go back to your basic Electronics 101 book and look up "degeneration".

The 10 ohm cathode resistors I mention in my Dentron GLA-1000
update actually deal with a couple of concerns. First, they provide
degeneration to the circuit which improves linearity... Fact.

Second, they provide a measure of both ac and dc balance to paralleled
g-grid tubes.

Third, they act as very practical and cheap series fuses when a tube shorts,
glitches or fails. No Mr Audio Breath... it's not my idea... I lifted the
knowledge
from a Collins grounded grid amateur amplifier diagram I saw many years ago.

You appear to be clue less on the subject.

>
> 18. You stated that voltage equalization networks are "dated

> use series connected rectifiers, opting instead for a single rectifier
> of the proper voltage rating (which of course doesn't need a voltage
> equalization network because one rectifier is not multiple rectifiers
> in series).

Old bad habits die hard and you are a good example of dated knowledge
Frankie... In short, the significant past issues with silicon diode mfgr
which brought about your happy equalization circuits are now for the
most part gone in modern power diodes.

At one time it was common to care for good reason, those reasons are
now long gone for the most part. Lose the rectifier eq networks... in
a different thread, I'll explain to you how they can now do more bad
than good vs leaving them out. Don't take my word for it Frank, look

at newer examples... Alpha Power, Ameritron etc...

> 19. You were totally unaware that the mic gain is the power control
> for an SSB radio, showing a gross misunderstanding of the principles
> of SSB modulation.

You really are out there Frankie... the mic gain on a typical Kenwood
TS-430s is not a true power control, whereas the Kenwood TS-940s
has a true power control.

The TS-430s is only a mic gain adjustment, not a power control. This is
a big issue when trying to avoid over driving and amplifier. You missed
the boat Frank.

> 20. You claimed that the interelectrode capacitances of a sweep tube
> are "easily dealt with", yet on the Dentron you failed to recognize an
> input capacitor used to compensate for the input capacitance of the
> tube, calling it one leg of a pi tank. In fact, you don't know the
> difference between a pi-tank and an L-pad, frequently using the term
> "pi-L" to denote something as yet unidentified.

At 28.5 MHz Frank, the tube Cin is often large enough to be the pi
output cap of the input circuit. In some cases, its so large, you have
to try other "non pi" inputs. In the Dentron GLA retrofit, I use a T input
>24MHz to deal with the large Tube Cin.

Pi-L from me would most often be applied to the output tank circuit only.

You called the tuned circuit inductor of the KLV amplifier and choke or
shunt. You simply didn't know what you were looking at.

> 21. You mentioned one of the drawbacks of running AB1 was dumping

> swamping resistor (when running AB2) because of the negligible power
> loss, and because it performs better at maintaining linearity of the
> signal under grid current transistions.

Man, you really go all over the place with each post... OK, let's have at.

First, there is a whole science unto itself when talking about grid driven
AB1 resistor - input circuit layouts and choices. You don't have any
knowledge market cornered Frankie.

In an AB1 circuit, the swamping resistor value choice is made using a number
of parameters better reviewed in a separate thread. You love your grid
current distortion safe house don't cha Frankie..? At this late date in the
game, I would feel pretty good writing that grid current distortion is not
really
on the radar map when choosing the swamping resistor value. In short, AB1
operation by definition has no control grid current flow. Simple enough...

When the grid driven circuit (one must note the difference vs g-grid/cathode driven) operates AB2; the swamping resistor value or "composite" grid circuit uses conventional design guidelines (way to complicated to detail here). The fly in you using only a low impedance tuned circuit only is the question of unconditional stability in high gain operation.

A better idea would be to consider a combination of both using the conventional
guidelines detailed in ARRL Handbooks. Your probably right, I must not have known that because otherwise I would have mentioned it somewhere... oh wait a minute..! I think there's a 4cx250b circuit on the sonic server that has an actual circuit diagram of the layout I mention above. Sorry if it's only
been available for 5 plus years Frank.

> 22. You haven't explained why grid-current distortion is "not an
> issue" with "most properly designed AB2 grounded grid amplifiers". In
> fact, you haven't even explained once what makes a "properly designed"
> amp. On the contrary, I have explained many times why AB2 IS a problem
> when the amplifier uses sweep tubes.

See the above under your number 15 babble Frank, it pretty much lays out the facts. Plus I offered you wine with your crow... ... and I did state that my Dentron GLA-1000 update text has a few good ideas on how one might design a good amplifier. Pick a tube Frankie, we'll rock and roll from your choice and build a big Boobner Special... or we can build your grid to the plate model and bask in the heat and flash of melting glass.

> 23. Whenever you don't know something you make up vague and
> nonsensical terms like "classic", "linearity detector", "passive gain
> operation", "traditional potentials", "beam power application", or the
> use of the term "low-mu" to designate a triode-connected sweep tube
> that doesn't work like a triode (and you still haven't explained how
> it works if not like a triode).

Linearity Detector... See the Collins and Galaxy brand amplifier diagrams on the sonic server. It's all there in simple english...

Passive Gain Operation: Pentode and tetrode grids in grounded grid amplifiers operation which contribute no active signal gain , but by their physical location and construction act as an electrostatic shield between the grid and plate... of course that includes the consequence that the pesty grid to plate capacitance is reduced.

Traditional Potentials: In a grounded grid sweep tube amplifier... HV on the

anode, a negative low impedance dc bias supply for #1 control grid.

Beam Power Application: Not sure where your going with it... but in my opinion, Sweep Beam Power tubes can make really nice, modest power level linear rf amplifiers. The best you can do is to agree to disagree.

Low Mu to designate a triode connected sweep tube... sure: All three grids tied to both dc and signal ground... A previously seen and elsewhere applied layout scheme which can lead to dangerous values of grid and or screen current.

Compared to many triode grounded grid AB2 amplifiers, the sweep tubes grounded grids screening or shielding action and consequential reduced grid to plate capacitance give it pretty good VHF stability.

In the VHF (parasitic problem) region, triodes with significant "hot" VHF gain operate have increased circuit stability concerns when compared to a grounded grid tetrode or pentode. Amplifiers such as the Kenwood TL-922 were pulled from the market for just such reasons although they'll never admit it.

> Who's the one lacking in RF theory and experience, Skippy? It ain't
> me, that's for DAMN sure!

Still got your potty mouth Frank... nothing we can do about it here except scold you about it. Anyway, enjoy your crow... and I hope the cabernet was the proper year.

Get some newer books, the ones your using in your posts are dated as is your actual knowledge of rf amplifiers. Maybe next time...

cheers
skipp

So, a dipole fed with an unbalanced feeline is not a dipole? That's
interesting. Hate to sound like Frank, but can you quote some reference to
back your stance on this?

The Mark 4 and the 4a are the same radio.What they did was correct a problem they had with the mark 4 pll chip.They also corrected the way the wires run under the chip and a voltage change.Most Mark 4's were sent back to the factory for the change and came back with 4a plates on it.

The dipole is a balanced antenna.
http://whatis.techtarget.com/definition/0,,sid9_gci214149,00.html
http://www.cqcqcq.com/baluns.html
http://www.hard-core-dx.com/nordicdx/antenna/feed/balun2.html
http://www.sandiego.edu/~ekim/e171f00/lab6.pdf

A dipole isn't the same as a ground plane, nor the same as a bi-conical,
although they are similar in form.

I'm not suggesting that the antenna actually changes per se, but that a
dipole fed unbalanced does not act the same as a dipole fed balanced, and
that a dipole is designed to be fed balanced.
Unbalanced with a choke isn't the same as balanced.

> >
> > There's an interesting evolution, if you compare dipole, "ground plane",

two
> > steps, but they are all different antennas.

I should have stuck the bi-conical in there too, but I'm not sure if it
properly would fit between dipole and ground plane, or discone and horn.

Thank you. Yes, some efficiency is lost, but as a cheap, alternative
antenna, all is not lost. And yes, dipoles do work better with baluns, but
it is not a neccesity, and many use "dipoles" without them. It is still a
dipole, no matter what the feedline configuration. That is the point I was
trying to make.

Your not very nice Frankie... such bad language.

Funny, but don't feel exposed... actually, your
boat is sinking fast Frank. I'm not able to park myself
on the net as you appear to do for hours to generate
hate posts across the news group(s). You win on the
matter of shear volume of posts.

I'd still like you to address the grid tied to the plate
triode mode comments you made in two or more posts. We'd
all like to see anything technical you've done, articles...
text, web pages... anything frankie..? I even said
please and offered up web space for you to at least be
able to "get it up" one more time in your life.

Now go check for hair loss... we'll still be here
when you get back.

1339. Dumb Ass on 27.285

Newsgroup: rec.radio.cb
Date: 2002-11-14 02:26:36 UTC
From: DutchMastahKillah <nodissin@nospam.com>
Message-ID: <JQDA9.16280$NV.303371@news.direcpc.com>
Source record: 143875

This is an example of a spectrum being totally ignored / un-enforced by the FCC!
At 4pm today in southside Virginia while on Rte 288 North,
Some dumb ass with a reverb or echo "toy" was heard "yelling" on CB Channel 28 (27.285 MHz) with the mic gain up.
WHY In Da Hell do these "CB'er wannabes" have to "Yell" into the mic?

CB channels 6, 11, 15, and 22 are some other places where this "uncalled for behavior" is heard and constantly bleeding over onto other channels.
And as always every cb'er wannabe is transmitting at the same time!!
All trying to see who can key-down with the most power!
The FCC totally ignores these!
(someone who works in the FCC alerts the violators of un-scheduled "visits")

Talking too fast and loud over the radio Distorts the output audio on other CBs / Shortwave Receivers.
Therefore creating an obvious profile of the one who is transmitting.

Is it to get the signal out --NO!!
Your radio's transmit power is 4Watts / 12 W PEP for SSB comms.
Linears are nothing but JUNK!!

SO, why have the gain up and yell and talk fast!
You don't get contacts to answer you as per the example above.

So, much money spent on Useless "TOYS" only distort your personality on the radio.

People want to talk on the radio -- Not to talk to, NOR hear, some dumbass yell with an echo/reverb "toy"" with the mic gain turned up!
Listen to the Amateur radio and MARS nets on HF.
When do they YELL?
When do you EVER hear an echo/reverb toy on their radios ?

Remember : Riley Hollingsworth IS Listening! and he's got your numbers, so is that van with the antennas on the roof!
Yeah-- you can flame me all you want to your heart's content!
You are only hurting yourselves when time comes to pay rent, bills, child support, medical, dental, auto insurance -that is if yours survives excessive RF energy that WILL destroy the ignition control module and whatever else is "in the way"!
So, keep on havin' those "keydowns"!!

I speak for the REAL CBers who ARE getting tired of this type of "crap" on the radio.

I despise these linears on CB!
What good are they to begin with? ---Making the most noise with all the RF power they can generate.
Who in the hell wants to put 8 alternators on their vehicle?
These individuals have WAY too much time on their hands!

I didn't know CBs, linears and AMPS and "noise toys" can be bought with welfare and food stamps.
A percentage of these "individuals" on the radio, are always on the radio -- not to talk their "aquaintences" in a good-fellowship atmosphere , BUT to yell into the mic with the echo and reverb and the mic gain turned up so "others" can hear them and have "key-downs" that only create a profile!

This creates an "unacceptable atmosphere" by law per the FCC, myself, and others who are talking local.

I really don't blame the majority of REAL 11-meter operators who go out of band just to get away from the "crap" either!
I applaude and salute them!
I have heard more intelligent QSOs on the freeband channels -unlike the 40 Channels that still exist!

And the FCC might as well make channel 9 -just a regular channel!!
If you don't have a cell phone to call in an accident in town or the city or the Interstate -- then the police don't want to hear it!!
Even if REACT is there!
Too many bogus calls -according to police who used to have CBs!
If that's the case then - what about Cellphone prank calls?!!

Someone needs to reform the FCC and get rid of "potential - leaks" in that agency!
A "Weed - And - Seed" Op. Per Say!!
Then reform the agency consisting of Hams and REAL CBers - like myself!!
And the next time a CB is bought --- A license form and fee will be mandatory!!!!!
NO EXCEPTIONS!!
NO WHINERS!!
NO MORE PROBLEMS!!

> trying to make.

It's only a dipole if you feed it from a balanced source. Otherwise, it's a monopole with a passive counterpoise. The wires don't change, but what happens around them does change.

Just about any damn thing will radiate somewhat, if you connect it to a signal source, and if you bend it around enough, you can usually make a decent impedance match to a feedline. That dosen't make it right.

actually pete.......the cb community does not have a problem with the
ham community.......what we on this newsgroup have a problem with are
these pinheaded terminal technician class hams who get on here whining
about dotting every i and crossing every t when it comes to fcc rules
and regs.....that is what we have a problem with...i can not say that
i speak for the group in any way shape or form, but this crap has been
going on now for about 3 years and it is getting tiresome. this
newsgroup used to be a cool place to hang out and do some
discussing......and arguing of course, but it was cber arguing against
cber and not like it is now...........this one guy who i think is a
ham named george busch from phili...........on here constantly
agitating and arguing at the drop of a hat and changing screen nics
every day almost, what a idiot.......and............aaron h
voobner.....aka dwight stewart......constantly arguing and whining
about laws and regulations..........hams like jerry oxendine
complaining on here about truck drivers etc, etc......talking on 10
meters.......like we have anything to do with that...........hams like
doc pretending to be helpful but giving out bad information and not
really discussing anything of importance and acting like we, ourselves
are nothing more than a bunch of mudducks........man i tell
ya........you guys police yourselves???? ok do some policing on
here........pete,,........go over to ham radio policy and bring some
help and run off these punks...pretty please.................

the big cheeser jus got down....

hey twist.......is dave's handle...'sandbagger'... on his ten meter
radio while he is operating in the freeband area????

1347. cb in NYC is alive and well

Newsgroup: rec.radio.cb
Date: 2002-11-14 03:51:04 UTC
From: Kenneth <pwrguy@intergrafix.net>
Message-ID: <ut67br58t38f80@corp.supernews.com>
Source record: 143883

CB is alive and well in NYC! And while I respect Jim's expertise there are a few things he has missed.
In NYC at least once a week a big truck hops on the parkway and gets stuck at the first overpass. Without cb's that would jump to atleast 2 a day. NYC would come to a screaching halt.
Some channels are used for recievers to communicate with trucks waiting to unload and are kept mostly quite out of common decency. Recieving depts learned to stay away from ch 6 and 11.
Trucking is THE lifeblood of the economy and cb's help the industry greatly. A cb is a tool that helps truckers accomplish their jobs beter and safer. Ham radio is a toy...nothing more.
Industry is mostly interested in data throughput for wireless WAN's and LAN's and that means higher freq's. 27mhz is quite safe. Companies are about as interested in 27mhz as buying antique 300 baud modems for dialup.
Hams may know more about rf then cb'ers but for the most part are ignorant of trucking and our economy and how they are related and how essential cb's are for the industry. Every train and mass transit system could brak down and it would be an inconvienence. A general truck strike would reduce the US economy to that of Bengladesh within a week.
The cb spectrum is quite safe.
Sincerely
Ken

I think he really means that it changes how that antenna works, but it
really does not change the type of antenna itself. He should have stopped
there.

Tom

Sorry for the late reply... I have just seen this post.

The Harrier is a UK CB on the old UK only frequencies.
It used the Cybernet board, and was sold by "Dixons" shops.

If the model is the "CB", then it is a basic, volume + squelch radio.
About £20 - £25
If it is the "CBX" then it has a few more controls.
About £25 - £30

Unless it has been fitted with both bands (UK + EU), in which case
you could add £10.
With the Power supply, add about £5... they are quite cheap new.

The "wee box" sounds like possibly a SWR meter... they are generally dirt
cheap new.

As for the "big mic thing" it depends upon which mic it is. They range in
price from a few quid upto stupid amounts for well known good mics. A
manufacturer and model name would help.

Regards,

Peter.

I am not sure whether it was a British term, or just an old
international term. Maybe some of the "old boys" on the group
could tell us.

In the book "Radio Circuits and Data", printed from 1948
(my copy, May 1952), it uses the terms...
cps - Cycles Per Second
Kcs - KiloCycles
Mcs - MegaCycles

The terms "Hertz", "Khz" and "Mhz" do not seem to appear
anywhere in the book. Although it does state that American
and English standards are included in the book.

Regards,

Peter.

And maybe the owner to use it :~)

Such devices are great, as long as you understand how to use
them and what you are looking for.
I find it amazing how many CBers go out and by devices such as
oscilloscopes, when they have no idea what they are, what they
do, how to use them or how to use any readings found.

It reminds me of the thinking behind the "Millennium Dome". They did not
know why they were building it, what they would use it for, whether anyone
would use it, what they would fill it with... just that they wanted one.
It really did not surprise me that it failed.

> His best bet is to connect his power meter between the radio and a 50 Ohm
> dummy load and see what the forward power says.

Absolutely.
I have seen so many naff "tune-ups" that I would go for that first.

Regards,

Peter.

1359. Re: MURS Consumer Radio Manufacturers

Newsgroup: rec.radio.cb

I just read on a site about MURS radios, Motorola and Tandy keep petitioning FCC to add more channels and then make MURS business use only. Motorola is also trying to get the FCC to change the rules so that the radios have the same kind of antennas as FRS radios. So that you can't use external antennas. Motorola already convinced FCC to change the rules so that MURS couldn't use repeaters anymore.

>replacement or application of exsisting legal equipment.

Take a look at Part 2 Subpart J:

=====
Sec. 2.927 Limitations on grants.

(a) A grant of equipment authorization is valid only when the FCC
Identifier is permanently affixed on the device and remains effective
until revoked or withdrawn, rescinded, surrendered, or a termination
date is otherwise established by the Commission.

Sec. 2.939 Revocation or withdrawal of equipment authorization.

(a) The Commission may revoke any equipment authorization:
....
(4) Because of conditions coming to the attention of the
Commission which would warrant it in refusing to grant an original
application.
=====

Now in case you have been in a cave the past few years, no amplifiers
between 24 and 35 MHz are being granted authorization because of the
following law:

=====
Sec. 2.815 External radio frequency power amplifiers.
(a) As used in this part, an external radio frequency power
amplifier is any device which, (1) when used in conjunction with a
radio transmitter as a signal source is capable of amplification of
that signal, and (2) is not an integral part of a radio transmitter as
manufactured.
(b) After April 27, 1978, no person shall manufacture, sell or

lease, offer for sale or lease (including advertising for sale or lease), or import, ship, or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency power amplifier or amplifier kit capable of operation on any frequency

or frequencies between 24 and 35 MHz.
=====

Which means that any amplifier that can operate between 24 and 35 MHz has lost it's certification/type-acceptance.

As for your query to the FCC about modification of your amps, you will find the answer here:

2.932 Modification of equipment.
2.1043 Changes in certificated equipment.

In case you are too lazy to read them yourself, they clearly state that you can't change the frequency range (and still use them under the original equipment authorization) without an additional grant of authorization, and then only if you hold the original grant. You don't hold the original grant of equipment authorization for those amps, do you Skippy?

Not only did you provide an invalid file number, but you flat out lied
about the IB service being current:

http://www.fcc.gov/Bureaus/Wireless/Public_Notices/1997/da972216.html

There is no more IB service, Skippy. It was one of the many services that was consolidated into the new IG service pool back in 1997. And you knew that because a notice was sent out to all IB licensees. You are just full of lies, aren't you Skippy?

=====

If you knew that the tube used for the "horizontal oscillator
amplifer" was the "sweep tube" then you wouldn't have contradicted
yourself in that post. The fact is that you didn't know that there is
no difference, and used your favorite buzzword "classic" to describe
the sweep tube. I especially like your line, "Horizontal oscillator /
amplifier was often the function of sweep and beam power tubes"
because not only is it 100% redundant, it reinforces the fact that you
didn't understand the definition of a 'beam' tube, either!

>The orginal post gets you to dance on the sweep tube labels, not big deal

>in your anal book world not exactly true.

Call it whatever you want. The fact remains that the term "sweep tube"
is applied to tubes used for television 'sweep' circuits. If you can
find a TV that used the 8950 then I'll call it a sweep tube, too.

As I said before, the amplification of a tetrode or pentode is
variable depending on the screen potential. When a tetrode or pentode
is rated by it's 'mu' it is under the condition that the tube is
operating as a triode. This should be obvious because the effective mu
of a tetrode/pentode operating as such is magnitudes larger than that
of a triode, yet when tetrodes and pentodes are rated by their mu it
is comparable with the mu of triodes. Check your datasheets if you
don't believe me. You do have datasheets, don't you? If not, try here:

http://www.cpii.com/eimac/index.html

>In specific to my post, certain tubes operate as low mu in grounded grid

That is totally ridiculous, as the mu of a tube has nothing to do with
how much grid current it is capable of handling!

>Applied Grounded Grid Pentodes and Tetrodes Amplifiers have complex sub

>and over.

This is funny, Skippy. First you say that a triode-connected sweep tube is not operating as a triode in your "classic" grounded-grid amplifier, yet you don't want to discuss the "complex sub topics" of grounded-grid tetrodes and pentodes. I'm was not diverting the topic, I was trying to get YOU to say specifically what the topic IS, and you still haven't been able to do that because you don't have a clue as to what you are talking about!

<snip>
=====

Not only did you say that reverse screen current is a factor in your
"classic" grounded-grid amp, but that it actually is responsible for
reducing grid-plate capacitance, as well as grid shielding between the
cathode and plate (which you say is the reason grounded-grid amps
don't require neutralization).

First, as I have said many times but you fail to seek the truth for
yourself, neutralization is not required in a grounded-grid amp
because it's a non-inverting amp.

Second, grid shielding means absolutely nothing in a grounded-grid amplifier -- if it did, then your input signal would never get past the grid to the plate!

Third, Cgp never changes because it's a characteristic of the tube, not the circuit. The capacitance AT the grid can change by changing the circuit, but that's the INPUT capacitance, NOT Cgp! I have said that many times as well, and just like every other fact, you have failed to verify it for yourself.

>You said it doesn't even exist... I called you on your statement to
>review basic tetrode amplifier 101 because it does in some classic
>tetrode circuits. Now your trying to big time back pedal here.
>Now you've looked it up and defined it above to try and save face. How
>novel that you are now an expert in reverse screen current when you
>clearly posted in one of your 10/31/02 posts "Now THERES a new one!"

I never said it didn't exist. Here is what I DID say:

>"Reverse screen current"? Now THERE's a new one! Is that how they get
>"bird watts", by using "reverse screen current"? LOL!

What would you expect me to say? Maybe something like, "Oh, gee, that clears up just about everything! By golly, why didn't I think of using reverse screen current when the screen and supressor/beam deflection plates are grounded! Of course, that would make the triode-connected sweep tube not act like a triode at all! Now all you have to do is to figure out how to get the secondary emission from the plate to the screen past the supressor/beam deflection plates..."

Dumbass.

Because space charge occurs in a tetrode and pentode regardless of
whether it's a beam tube or not, which is why pentodes have a
supressor grid! Go review your vacuum tube fundamentals, Skippy!

> A more serious directly
>related issue with beam power tube missing from your post is any
>mention of electrode spacing. Electrode spacing is a serious property of

Do you mean the spacing between the electrodes, or the spacing of the
wires OF the electrode, or how the wires on the screen of a beam tube
are located directly behind the wires of the grid forming an electron
'beam'? Sorry, Skippy, I already covered all that. But there are
frequent examples where you use the terms 'beam' and 'power'
interchageably, demonstrating that you didn't know what makes a beam
tube different than any other power tube. Especially when you use
phrases like "beam power applications". LOL!

It's such a minor issue that manufacturers spent jillions of dollars
to develop power tubes designed specifically for smooth grid-current
transition in AB2 operation. Sure, Skippy, whatever you say.

Since you don't have much education in electronics, let ME give YOU
the word: Although most grounded-grid amps may be AB2, that doesn't
necessarily mean AB2 is grounded-grid because there are many AB2
common-cathode amps! And guess what, Skippy? Those common-cathode amps
usually require neutralization! As usual, you don't know what you are
talking about.

> The original topic is
>Sweep Tube amplifiers in grounded grid operation, that is AB2.

The original topic was a couple of questions that you haven't been
able to answer. Beyond that, the topic has been about sweep tubes vs.

RF power tubes, and you have been trying to narrow that topic down to grounded-grid amps only, ignoring the fact that sweep tubes were used in many common-cathode applications.

>Yep, greater than 180 degrees.

Not 180 undistorted degrees. In case you haven't noticed, the grid is
usually biased slightly negative with repect to the cathode, making
the grid current transition occur within that 180 degrees. And because
the bias is so slightly negative it also tends to make more noise at
lower power levels than high power peaks.

> The big picture here is the grid current
>distortion in the topic amplifier is not large enough to prohibit the

Despite your repitition, all you need to do is to look at the numbers.
The Dentron claims -30 dB IMD and -40 dB on harmonics, which sucks for
a kilowatt amplifier.

That's not a "linearity detector", and the article doesn't even call
it that. Your "linearity detector" is an AMPLITUDE COMPARATOR which
controls the bias regulator -- it's an ALC circuit, Skippy!

>control. RF compression is not such a good label frankie...

The acronym 'ALC' stands for Automatic Level Control which, for all
intents and purposes, is a compressor. The ALC is a circuit that
reduces the input or gain when the amplifier becomes overloaded. By
comparison, a limiter is basically a clipper, which necessarily causes
distortion.

As far as their being too "slow", most of them begin to react after
the very first or second RF peak. I suppose a couple peaks are going
to sneak through before the output level is reduced, but that's a
whole lot better than each every RF peak being clipped from a limiter.

>Many Amateurs using ALC are clueless about the actual circuit operation.

Yourself included.

>Before the ALC acts (time constant)... unwanted poop is piped out the
>coax connector to the antenna.

See above.

>Depending on the ALC to throttle your tubes back results in much higher
>levels of initial pre alc action poop. You can hear that poop as buckshot
>up and down the band...

Yes you can if the amp is severly overdriven. Even an ALC has it's
limitations. But an RF limiter creates horrendous amounts of splatter
even at normal signal levels, just as if the amplifier were being
driven into saturation. That's why RF limiters are not used in power
amplifers, but ALC circuits are used instead.

>: you claimed had "linearity detectors". You also claimed that ALC
>: circuits are "dated technology" despite their continued and effective
>: use in amplifiers and other circuits.

It still does.

>Relying on it for rf compression is poorly applied technology. If you
>were to look at your signal before the ALC acts... much unwanted poop is
>generated. Especially in SSB operation with voice compression.

The 'compression' to which you refer is actually CLIPPING of the audio
peaks to prevent the amplifier from being driven into saturation on
those peaks. It's funny how you got 'clipping' and 'compression'
reversed!

It claims 30 dB down on IMD and 40 dB down on harmonics. It doesn't
mention the conditions under which those figures were achieved.
Regardless, those are piss-poor figures for a 1000 watt amp, since the
IMD alone puts out nearly 1 full watt:

=====
Sec. 97.307 Emission standards.
......
(d) The mean power of any spurious emission from a station
transmitter or external RF power amplifier transmitting on a frequency
below 30 MHz must not exceed 50 mW and must be at least 40 dB below
the mean power of the fundamental emission. For a transmitter of mean
power less than 5 W, the attenuation must be at least 30 dB. A
transmitter built before April 15, 1977, or first marketed before
January 1, 1978, is exempt from this requirement.
=====

> They are FCC legal amplifiers which is all that matters.

ONLY because of the exemption, NOT because of the RF performance of
the sweep tubes, which basically sucks.

> The
>FCC said go and the various mfgrs legally built them.

And after they learned from their mistake they changed the rules.

> The mid 80's ARRL
>Handbooks show great examples of sweep tubes in rf amplications. I

I was pointing out that your melodramatic concern about parasitics in
RF power tubes is unfounded, since the use of a simple parasitic
supressor is usually more than enough to prevent high-frequency
parasitics REGARDLESS of what type of tube is being used. With that in
mind, RF power tubes have no predisposition to parasitics as you
claim. The difference is in the circuit, NOT the tube!

You responded to a post where I critiqued the KLV, saying that it was
probably intended for the CB market, and....

"...with that in mind, the pre-amplifier is effectively useless, doing
nothing other than making the noise floor louder."

To which you replied:

>Companies like ARR, Sinclair, Telewave and Angle Linear all make various
>fet amplifiers... If the noise figure is less than say 1.5 dB, but the
>signal gain is greater
>than say 13 dB, doesn't that sound like a pretty good preamp..? Even
>if it were a lower gain Dual Gate fet..? would you say the advantage is
>overkill..?

And prompted me to simplify my statement so that even you could
understand that:

>If your receiver is already sensitive enough to receive the noise
>floor, a preamp is not going to improve the signal-to-noise ratio. In
>fact, the preamp is going to add to the noise by the stated 1.5 dB,
>but it will increase the noise floor by 13 dB!

So you see, it wasn't such a "broad" statement at all. My statement is
what is commonly referred to as a 'conditional statement', and was
quite specific.

> I don't agree... not everyone has a hot
>receiver. A switchable low noise fet preamplifier is a very good thing
>and relatively cheap in cost. Not everyone has your magical hot as a
>firecracker receiver... in fact some of the Icom 706MKIIG radios I've
>tried have pretty numb receivers.

Most CB radios (and by 'most' I mean just about every CB radio that
has ever been manufactured AND is working properly) have receiver
sensitivities in the range of 3 uV, which is plenty sensitive enough

to hear the background hash that pervades the band almost constantly. And knowing that the noise on the CB is much greater than many other bands, a pre-amplifier is, as I said before, practically useless. It does not improve the signal-to-noise ratio, and actually degrades it by it's insertion. Preamps are primarily intended for receivers with weak front ends, such as older radios and homebrew rigs. They really make the difference with those one-tube regen rigs, older SW radios, and even crystal radios. But all they do with a CB radio is make the noise louder.

Yes there are, but that's not the point. You claimed that
neutralization was not required because the grid was grounded and
screened the cathode from the plate. By that statement you proved that
you have no clue as to the purpose of neutralization, the cause of
regenerative feedback, or the operation of a grounded-grid amplifier.

Neutralization is NOT used to prevent parasitics, it's used to prevent
regenerative feedback from turning the amplifier into an oscillator on
the resonant frequency of the amplifier! By golly, you don't even know
how an oscillator works! Talk about bogus...!

>shielding function and reduced Cgp in the grounded grid circuit.
<snip>
=====

There you go, your exact text. And in your exact text you describe a
number of misconceptions:

1. The screen grid does indeed shield the control grid from the plate,
but it does so ONLY when there is a signal on the grid to be shielded.
You don't have a signal on the grid of a grounded-grid amplifier.

2. The effect of adding a screen grid to a TRIODE reduces the
grid-to-plate capacitance of the tube. The Cgp of a tube DOES NOT
CHANGE because it's connected as a triode in a grounded-grid
amplifier! In fact, it effectively does the opposite....

3. Since your sweep tube is connected as a triode, the screen and supressor (G2 and G3) are grounded with G1, and all three become the EFFECTIVE grid. Therefore, the G1-to-plate capacitance is added to the G2- and G3-to-plate capacitances, making the EFFECTIVE grid-to-plate capacitance HIGHER than the Cgp of the tube. In fact, the EFFECTIVE Cgp is more along the lines of the Cgp of a TRIODE (which shouldn't be so suprising since the tube is connected and operated as a TRIODE)!

4. I don't know how many times I need to repeat this before you finally get a clue and look it up for yourself, but I'll do it one more time: a grounded-grid amplifier does not require neutralization simply because it is a non-inverting amplifier which causes no regenerative feedback requiring neutralization -- NOT because of reduced Cgp or 'grid shielding', which are properties of the tube regardless of whether it's used as a grounded-grid or common-cathode amplifier.

By your statements above -- about how AB2 requires input power but AB1
does not -- it's clear that you think input power is required only
when grid current flows. You are very, very wrong, Skippy. ANY class
of grounded-grid amplifier consumes input power (meaning power from
the signal source). The input is on the cathode, and it is impossible
for the tube to conduct (and therefore amplify) if there is no cathode
current. Part of that cathode current MUST come from the signal source
because it is IMPOSSIBLE to impose an AC signal on the cathode without
AC current! Once again you demonstrate not only your ignorance on the
subject, but your total lack of willingness to verify the facts for
yourself.

>Got to go, back later to finish... love ya frankie,

I know.

> keep trying.
>skipp

Keep trying yourself. You might try to check the validity of your
statements before you demonstrate your ignorance even further by
continuing to defend them.

Well, since you claim to have found my 'files' that don't exist, I
would have to say that the web is much more trustworthy than you are.

<snip>
> It's quite
>clear to most experienced amplifier people that AB1 and AB2 g-grid
>amplifier circuits are for the most part, built along two different circuit
>layouts.

Not even close, Skippy. Grounded-grid amps can be built for AB1 where
the gain of the tube is high (although it's not common it has been
done), and common-cathode amps are frequently built for AB2 operation.
But that's a nice try at an excuse for your lack of understanding.

>You claimed that triode amplification factor was listed in your book
>as "u" and that tetrode/pentodes were rated in transconductance Gm.
>Some how you failed to mention triodes also have transconductance, so
>now we can say that "you didn't know it". Get off the "you didn't know
>it" because "you didn't mention it" nit pick... you waste a lot of time.

Of course triodes have transconductance. All amplifying tubes have
transconductance because that's how they work: voltage in, current
out. Triodes are usually rated by their mu because a change in the
plate voltage causes a significant change in plate current, something
that doesn't happen with the tetrodes and pentodes because of their
high plate impedances. And because the potential on a screen grid can
affect the amplification factor of a tetrode or pentode, those tubes
are usually rated for their transconductance only, not their
amplification factor. But you knew that, didn't you Skippy?
(yeah, right...)

>> 4. You didn't know where the 'beam' in 'beam tube' came from, but

>amplifiers, I do tack on the entire proper label of beam power tube. No
>foul should be called.

That's a pretty good excuse, but not good enough: You fail to realize
that not all RF amplifier tubes (or sweep tubes for that matter) are
beam tubes.

>If you ever update your electronics back ground to include current technology,
>
>you'd understand the Sweep Tube Label can be applied to a family or group of
>similar tubes.

If you ever update YOUR electronics background to include current
technology, you might notice that tubes haven't been used in
television sweep circuits for nearly 30 years. Now THAT's "dated
technology"!

>The 6KG6 was probably designed for horizontal deflection "sweep" circuits, a

>has direct rf amplifier applications. I have no problem calling the EL-509
>a Sweep Tube as it walks and talks the part very well. In short, they
>directly
>interchange or are considered the same tube.

Some tubes are designed for RF applications while others were designed
for television sweep circuits. Seems simple enough to me.

>Multiple examples of Sweep Type Tubes or the easier named (by most
>people) Sweep Tubes never designed or applied to Horizontal "TV" or
>deflection circuits exist. Go ahead and stick your head in the sand over a
>dated formal label. Most of the rest of the world has no problem using the
>Sweep Tube as a generic type label, it fits very well.

You are taking a specific application and turning it into a "generic
type label" simply because you won't admit that you didn't know for
what application sweep tubes were specifically designed. Pretty lame
excuse, Skippy. And not nearly as creative as your other excuses.

<snip>
>> 6. You have shown many times that you didn't even know the difference
>> between Class AB1 and AB2 operation, the difference being that AB1

HA! THAT'S a laugh! YOU were trying to nail ME down? It was ME that
was trying to get YOU to describe your "classic" amp, the details of
which are STILL vague!

>In the real amplifier world Frankie... AB1 is common cathode circuit layouts
>and AB2 is a grounded grid circuit. AB2 is also possible in common cathode
>circuits, but we almost never see AB1 operation in grounded grid circuits.

Quit backtracking, Skippy. Your comment about neutralization not being
required in an AB2 amp CLEARLY demonstrates that you didn't know that
a common-cathode amps can (and frequently do) operate class AB2.

>Don't play around with parts of sentences Frankie... I try to be clear and
>include the term, well built "AB2 Grounded Grid" circuits should not
>require neutralization. The issue is to include grounded grid which you
>conveniently left off.

I left off nothing. Here's the exact quote:

>
>: I remember my Uncle tried one once and he kept blowing tube
>: after tube until he finally added enough neutralization to keep it
>: from oscillating into smoke. He wasn't the only one, either.
>
>No sweep tube amplifier I have requires neutralization. It's not required
>in a properly designed AB2 amplifier.
>

And in case you want to look it up yourself:

Message-ID: <ap99mqgls1@woodrow.ucdavis.edu>

...Oh, wait, I get it: When you say "properly built AB2 amplifier" you mean grounded-grid; and since a common-cathode amp can be AB2, that means a grounded-grid amp is "properly built" and a common-cathode amp is not! Now don't tell me I'm twisting your words, Skippy, because that's EXACTLY what you said!

Absolutely true.

> One must always keep in mind that
>the drive is actually applied across the cathode and grid.

In a grounded-grid amplifier it's applied across the cathode and ground.

> Inclusion of
>a AB2 cathode tuned input tank circuit, Q of 2 is almost a must to achieve
>good IMD performance.

How did you arrive at your Q figure of 2? Roll of the dice?

> In your verbose analysis of that KLV brand
>amplifier.... you called the tuned input coil a choke or shunt. You can't
>even call them when you see them Frankie'boy.

In my verbose critique of the KLV I mentioned nothing of the input circuit. Get your quotes straight next time. But the KLV uses the same type of input as the Palomar: an L-pad with a shunt capacitor to compensate for the collective tube input capacitance. Not the best circuit, but not quite a tank.

>I explained to you that the conduction angle for AB* operation is about
>210 degrees standard to be called "AB mode".

Oh really? When did you say that? I must have missed that post -- care to quote yourself? And last time I checked Class AB was anything greater than 180 degrees and less than 360 degrees. But then you probably have a different opinion than the generally accepted fundamentals... you usually do.

> The amount of distortion
>present does not disqualify Sweep Type Tubes and many Sweep Tubes
>from linear applications,

...uh huh... and that's why we see so many grounded-grid audio amps
built with sweep tubes... right... sure thing, Skippy.

> nor does the distortion prevent the conduction
>angle from reaching ~210 degrees. Plain fact, jack...

Where did I say that distortion would prevent conduction to 210
degrees? or even beyond 180 degrees? I never said anything of the
sort, Skippy. "Plain fact, jack..."

>> 8. You didn't know that 'grounded' in 'grounded-grid' means a signal
>> ground, and not necessarily a DC ground.
>
>Sure I do, but you never bothered to mention ac or dc paths until I pointed
>it out.

You pointed it out because you were trying desperately to find a way
to defend your argument that a triode-connected sweep tube doesn't
work like a triode, but instead like a "low-mu" something-or-other.

> There are different types of grounded grid circuit layouts. Some
>only play well with specific geometry types of tubes as built. You don't
>appear to know the difference between them without looking at a book.

Perhaps you could explain these 'geometries' and 'circuit layouts',
and why some don't work with the other? Well, maybe I shouldn't ask
that since you still haven't explained why a triode-connected sweep
tube doesn't work like a triode.

<snip>

>plain out of touch with the real world.

The spikes referred to in those threads are caused by either a design
flaw or operator error. They describe the spikes occuring on keying,
which means that the amp/final is overdriven to start with. Without
more details, my first guess is that someone tried to tweak their
radio for more power and didn't understand the electronics behind what
they were tweaking. (I can't even count how many times I have heard
the line, "NO, I didn't mess with ANYTHING inside the radio!")

And despite your attempt to prove that ALC circuits are "dated", you
proved yourself wrong by referencing modern radios that use them.
"Plain fact, jack..."

>> 10. You continue to claim that sweep tube amps meet or exceed FCC
>> specifications, yet you never state those specifications or the

>a significant problem. T'was a good sweep tube circuit...

32 dB isn't that great, Skippy. Matter of fact it's pretty bad for an
amp in the kW range. "You are just plain out of touch with the real
world." Even better, those distortion figures are "dated" because the
FCC reduced the maximum spurious emission levels a long time ago. LOL!

<snip>
>The 6146 and 4cx250 family of tubes require serious parasitic prevention
>"circuit practices" (as do many others).

Now that's a total crock! You remember all those ARRL handbooks you
said have all those sweep tube amps? Well look again and you will see
even MORE projects with 6146's and RF tetrodes, and all of them use
nothing more than a run-of-the-mill parasitic supressor. Enough with
your scare tactics, Skippy!

> Other tubes (8877) in rf circuits
>don' have nearly the parasitic baggage concerns of the 6146/4cx250b by
>design.
>
>No tube is immune to parasitic... but the sweep tube in grounded grid
>circuit will rarely, if ever "go there" in a well designed and built circuit.

Does that "well designed" circuit include parasitic supressors on the
plates? Every amp you have referenced so far has them. So are they
there just for looks? Come to think of it, you still haven't come up
with the make/model of radio or amp that you claim was pulled because
of parasitic oscillation problems. Well?

>> 12. You didn't realize that if a receiver can hear the background
>> noise on a frequency that a pre-amplifier does not improve the

>> feedback!).
>
>Here is where you really fall short Frankie... Go back and do the home
>work. HF and MF frequency amplifiers have two resonance's IN THE
>ANODE CIRCUIT, the VHF resonance is formed by the Anode-C, the
>Anode leads, the dc blocker caps reactance, and the tune-C.

This is where your lack of education shows, Skippy: The inductance of
the plate circuit is in the plate leads only, which makes a tank with
a very high Q. The addition of the inductance from a parasitic
supressor lowers the Q (and the frequency), and provides the majority
of the inductance of any tank formed by the circuit. This additional
inductance is important because the resistor of the parasitic
supressor across the inductor drops the Q of any resonant tank well
below the point where it maintains oscillations. And THAT'S how a
parasitic supressor works. And not only does it work for the anode
circuit, it works for any high-frequency resonant condition of which
the anode is a component. The result: high frequencies don't get
amplified enough for feedback to occur.

But you know what, Skippy? I wasn't talking about parasitics! As I
stated in the other post, neutralization is required to prevent
regenerative feedback at the frequency of operation!

>Grounded grid circuits benefit from shielding. You also failed to
>mention electrode spacing in any of your posts so we just state that
>" you don't understand it".

We can talk about electrode spacing if you want. Is that your newest
excuse-without-an-explanation for your triode-connected sweep tube
that doesn't work like a triode?

>The non inverting nature of the layout at HF/MF a whole different
>animal vs when your talking VHF stability response.

The topic was neutralization, not parasitic supression. You keep
ignoring that fact, and for reasons I can only speculate -- is it
because you don't know the difference? Naw, that couldn't be it...

> You above
>statement clearly indicate you have little actual knowledge or experience

>
>The Grounded Grid Amplifier have or include the advantages:
>
>The output and input capacitance's of a stage are reduced to approximately
>one half the value which would be obtained if the same tubes were
>operated as a conventional neutralized amplifiers.

Do you mean common-cathode? If that's what you mean then use the right
terminology instead of making up your own.

Regardless, let's compare your statement with reality. How about a
triode for starters:

3CX1500A7
Capacitance Grounded Cathode
Input 38.5 pf
Output 0.1 pf
Feedthrough 10. pf

Capacitance Grounded Grid
Input 38.5 pf
Output 10.2 pf
Feedthrough 0.1 pf

Well, the input capacitance is exactly the same and the output
capacitance is 100 times LARGER in the grounded-grid! Let's try a
tetrode:

4CX250B
Capacitance Grounded Cathode
Input 15.7 pf
Output 4.5 pf
Feedthrough .04 pf

Capacitance Grounded Grid
Input 13.0 pf
Output 4.5 pf
Feedthrough .01 pf

Oh my goodness, the input capacitance of a grounded-grid amp IS
smaller, but falls way short of your claim that it's half the value of
a common-cathode amp. And notice that the output capacitance doesn't
change one bit. Gee, Skippy, looks like the facts don't quite agree
with your opinions!

>The feedback capacitance within the stage is the plate to cathode
>capacitance which is ordinarily very less than the grid to plate
>capacitance. Hence neutralization is ordinarily not required in the
>the HF region.

Incredible! You are STILL ignoring the fact that a grounded-grid is a
non-inverting amp, and you STILL don't understand what causes
regenerative feedback! This is totally mindboggling, because anyone
that has had the patience to follow this thread (very few I'm sure)
has already looked it up for themselves and found out that you are WAY
off base! Yet, for some unknown reason, you are bound and determined
to profess your ignorance. Oh well, who am I to argue with Milton?

>The tendency toward parasitic oscillation is greatly reduced since
>the shielding effect of the grid(s) are effective over a broad range of
>frequencies.

What happened to your claim that parasitics are caused by resonance in
the anode circuit? After all, that's about the only thing you have
gotten right in this post (even though it was only partly right).

>> 15. You stated that "exciter feed through power of the example AB2
>> grounded grid amplifier is a big time 'freebie' you don't see in AB1
>> circuits", which only reinforces my theory that you really don't
>> understand amplifier classes of operation. Grounded-grid amps require
>> drive power because the input is the cathode, which must conduct if

>> is always carried to the plate regardless of class of amplification,
>> and regardless of grid-current.
>
>You try and make some type of point from the wrong direction Frank.
>Let's be clear about this, not how you like to read into things. Feedthrough
>power is a benefit of the grounded grid rf amplifier operating condition.

It's an effect. I wouldn't necessarily call it a benefit.

>Actually he label is a bit mis leading (but you knew that of course)... the
>drive power appears in the g-grid plate load circuit after being converted
>to a varying dc plate potential effectively in series with the main HV
>power supply.

Very good, Skippy.

>HERE'S THE BIG ONE FOR YOU FRANKIE...! CHECK IT OUT.
>
>The converted drive power serves a useful function in linear service
>because It Swamps Out The Undesirable Effects of Nonlinear Grid Loading
>
>.... and presents a reasonably constant load to the exciter.
>
>Ta'da..! Frankie...! and how would you like your crow served today...?

Excellent explanation for input loading on a grounded-grid amp with a
TUNED input. You can indeed swamp the changing impedance at the
cathode with a low-impedance signal source, and I have already stated
that much.

Now try and address the topic: You claimed that "class AB1 operation
of grounded grid amplifiers does not consume input power." You are
wrong, and you can find the truth in any basic electronics textbook...
oh, that's right, you don't like books!

>> 16. You claimed that grid-current distortion only occurs in a
>> grid-driven circuit. Of course that's not true, as grid-current
>> distortion occurs whenever grid current occurs, regardless of whether
>> it's grounded-grid or common-cathode.
>
>See the above for more crow Frank... perhaps some wine with your bird..?

Ignorance and arrogance are not very good partners, Skippy. It's
obvious that you missed some of my posts. But it's unbelievable that,
even after I gave you the message ID's, you haven't bothered to update
your news browser, or even read the missing posts by looking them up
on google. You see, Skippy, I received a few emails on this very
subject, and I followed them up with a reply to my own post which goes
into more detail about grid-current distortion. Perhaps you should
find that post and read it (along with several other posts) before you
verbally gloat over your illusion of victory.

>> 17. You claimed that putting a resistor in series with the cathode of
>> a grounded-grid amplifier will improve linearity, when in fact it does
>> nothing but reduce the output power and dissipate part of the input
>> power. I also pointed out how cathode resistors are commonly used to

>> amplifiers because it would unground the cathode. Such practice is an
>> audio technique that you mistakenly applied to an RF application, and
>> also to the wrong type of amplifier.
>
>You are wrong crow breath... at least in this post you have properly
>written the statement as "resistor in series with the cathode". Now
>go back to your basic Electronics 101 book and look up "degeneration".
>
>The 10 ohm cathode resistors I mention in my Dentron GLA-1000
>update actually deal with a couple of concerns. First, they provide
>degeneration to the circuit which improves linearity... Fact.

Not on a grounded-grid amplifier. You need to read that Electronics
101 book yourself.

>Second, they provide a measure of both ac and dc balance to paralleled
>g-grid tubes.

If you mean load equalization, then yes they do. I have already stated
that.

>Third, they act as very practical and cheap series fuses when a tube shorts,
>glitches or fails. No Mr Audio Breath... it's not my idea... I lifted the
>knowledge
>from a Collins grounded grid amateur amplifier diagram I saw many years ago.

Your 'glitch protection' probably isn't going to do you any good.
Let's assume the very unlikely scenario that the plate shorts to the
cathode without shorting to one of the other three grounded grids.
First, your current will surge out of your power supply caps and
probably fuse the offending short or the tubes internal wires before
it pops the resistor. But even before that happens you will have
nearly a one-thousand volt spike on the cathode, which will almost
certainly arc the tank of either the input circuit or the exciter
(which is why I criticize the KLV and other amps for not having a DC
blocking cap on the input). Now since we already know that the tube is
toast, the decreased voltage from the power supply isn't going to hurt
the other tubes at all; but the increased current, even for a short
time, may overload the power supply rectifiers. That would be a good
thing if the rectifiers consistantly blew open. But if you have any
experience with semiconductors you would know that they can also short
when overloaded, and that would be fatal to the power supply
transformer.

You want glitch protection? Put a single current-limiting resistor
between the power supply and the RF choke[s]. Even better, toss the
amp in the trash and get one with proper over-load protection, such as
power supply relay latching, a solid clamping circuit, and even ALC
circuits can afford some measure of protection against faults. (I can
see your face turning red, Skippy! LOL!)

>You appear to be clue less on the subject.

You appear to have no experience with failure analysis, and no
education in amplifier fundamentals.

>> 18. You stated that voltage equalization networks are "dated
>> technology", claiming that almost no amplifiers use them anymore. This
>> is not only a slap in the face of good engineering practices, but also
>> flows against basic semiconductor theory: Exceed the PIV and the
>> rectifier may fail. Regardless, most amplifier manufacturers do not
>> use series connected rectifiers, opting instead for a single rectifier
>> of the proper voltage rating (which of course doesn't need a voltage
>> equalization network because one rectifier is not multiple rectifiers
>> in series).
>

>Old bad habits die hard and you are a good example of dated knowledge
>Frankie... In short, the significant past issues with silicon diode mfgr
>which brought about your happy equalization circuits are now for the
>most part gone in modern power diodes.

As long as rectifiers continue to fail when the PIV is exceeded, the
practice of voltage equalization continues to be current. Or do you
think semiconductor theory is "dated", too?

>At one time it was common to care for good reason, those reasons are
>now long gone for the most part. Lose the rectifier eq networks... in
>a different thread, I'll explain to you how they can now do more bad
>than good vs leaving them out. Don't take my word for it Frank, look
>at newer examples... Alpha Power, Ameritron etc...

Perhaps you are thinking of those rectifier modules that are currently
being manufactured. Would it suprise you to learn that those modules
are nothing more than series rectifiers and voltage equalization
resistors all wrapped up into one package? Probably.

>> 19. You were totally unaware that the mic gain is the power control
>> for an SSB radio, showing a gross misunderstanding of the principles
>> of SSB modulation.
>
>You really are out there Frankie... the mic gain on a typical Kenwood
>TS-430s is not a true power control, whereas the Kenwood TS-940s
>has a true power control.

Am I missing something here? Is SSB power not directly related to the
audio level? Is the audio level not directly controlled by the mic
gain? What's wrong with this picture, Skippy?

>The TS-430s is only a mic gain adjustment, not a power control. This is
>a big issue when trying to avoid over driving and amplifier. You missed
>the boat Frank.

If you don't want to overdrive your amp then turn down the mic gain.
If you want to increase your talk power then utilize the radio's
speech processor. Real simple. Maybe too simple...

>> 20. You claimed that the interelectrode capacitances of a sweep tube
>> are "easily dealt with", yet on the Dentron you failed to recognize an
>> input capacitor used to compensate for the input capacitance of the
>> tube, calling it one leg of a pi tank. In fact, you don't know the
>> difference between a pi-tank and an L-pad, frequently using the term
>> "pi-L" to denote something as yet unidentified.
>
>At 28.5 MHz Frank, the tube Cin is often large enough to be the pi
>output cap of the input circuit.

Now I know for SURE that you don't know what a pi tank is. The tube
input is a capacitive load in SERIES with the input inductor (as you
previously stated above), and is NOT the shunt capacitance required

for a pi tank. What you have, in effect, is a modified L, not a pi. It
may or may not be resonant. But regardless what whatever you think it
is, if it IS resonant then it would require tuning just as often as
the output tank, a fact which contradicts your claim of a
set-it-and-forget-it input tank.

> In some cases, its so large, you have

>Pi-L from me would most often be applied to the output tank circuit only.

Ok, but what is it? Don't you even know what your own terminology
represents?

>You called the tuned circuit inductor of the KLV amplifier and choke or
>shunt. You simply didn't know what you were looking at.

You don't even know what you are talking about because, as I said
before, I never said anything about the input circuit of the KLV.

>> 21. You mentioned one of the drawbacks of running AB1 was dumping
>> power into the swamping resistor, which means that you have no idea

>> loss, and because it performs better at maintaining linearity of the
>> signal under grid current transistions.
>
>Man, you really go all over the place with each post... OK, let's have at.

Oh boy, this should be good!

>First, there is a whole science unto itself when talking about grid driven
>AB1 resistor - input circuit layouts and choices. You don't have any
>knowledge market cornered Frankie.

...blah, blah, blah. Get to the issue already.

>In an AB1 circuit, the swamping resistor value choice is made using a number
>of parameters better reviewed in a separate thread. You love your grid
>current distortion safe house don't cha Frankie..?

....number of parameters....seperate thread....avoid the issue....
Quit stuttering and get on with it.

> At this late date in the
>game, I would feel pretty good writing that grid current distortion is not
>really
>on the radar map when choosing the swamping resistor value. In short, AB1
>operation by definition has no control grid current flow. Simple enough...

Duh! How much arrogance did you have to swallow to admit that? I'll
bet it left a bad taste in your mouth!

>When the grid driven circuit (one must note the difference vs g-grid/cathode
>driven) operates AB2; the swamping resistor value or "composite" grid
>circuit uses conventional design guidelines (way to complicated to detail
>here). The fly in you using only a low impedance tuned circuit only is the
>question of unconditional stability in high gain operation.

....conventional guidelines....too complicated....avoid the issue....
You're stuttering again, Skippy!

>A better idea would be to consider a combination of both using the
>conventional
>guidelines detailed in ARRL Handbooks. Your probably right, I must not
>have known that because otherwise I would have mentioned it somewhere... oh
>wait a minute..! I think there's a 4cx250b circuit on the sonic server that
>has an actual circuit diagram of the layout I mention above.

What layout did you mention above? All you said was vague and
non-specific things like "conventional guidelines" and "composite grid
circuit".

> Sorry if it's
>only
>been available for 5 plus years Frank.

And I'm sure that during all those years it has been a wonderful
example of poor engineering. Why did you even include the tuned
circuit? That has to be one of the most stupid designs I have ever
seen! (I tried to pick a better word than "stupid", but nothing else
fit). First off, this is an AB1 amp, right? Your "swamping" resistors
aren't swamping resistors at all -- they are load resistors for your
exciter -- to dissipate the input power! And since you put them in
parallel with your tuned circuits you shifted the decimal point of the
tank's Q two places to the left. I'm sure you noticed that tuning is
necessary in order to get a good output, but that's because detuning
your input circuit will shunt the signal right to ground! If you leave
that tuning mess completely off the input you will not only get the
same output as when it's tuned, but it will be broadband to boot! If
you REALLY want a tuned input, make it a series LC circuit so you
won't be overloading your exciter if you forget to tune it. Or leave
it broadband and just add a low-pass filter, and then you won't even
need that parasitic choke on the grid.

...judas priest... load resistors in parallel with a tank... And you
are PROUD of that? What a dumbass.... composite grid circuit, too
complicated... where do you come up with this BS, Skippy?

>> 22. You haven't explained why grid-current distortion is "not an
>> issue" with "most properly designed AB2 grounded grid amplifiers". In
>> fact, you haven't even explained once what makes a "properly designed"
>> amp. On the contrary, I have explained many times why AB2 IS a problem
>> when the amplifier uses sweep tubes.

>

>out the facts. Plus I offered you wine with your crow... ... and I did
>state that my Dentron GLA-1000 update text has a few good ideas on
>how one might design a good amplifier. Pick a tube Frankie, we'll rock
>and roll from your choice and build a big Boobner Special... or we can
>build your grid to the plate model and bask in the heat and flash of melting
>glass.

Seems the only argument you have left is knocking me for a mistake
that I freely admit. Bad form, Skippy.

>> 23. Whenever you don't know something you make up vague and
>> nonsensical terms like "classic", "linearity detector", "passive gain
>> operation", "traditional potentials", "beam power application", or the
>> use of the term "low-mu" to designate a triode-connected sweep tube
>> that doesn't work like a triode (and you still haven't explained how
>> it works if not like a triode).
>
>Linearity Detector... See the Collins and Galaxy brand amplifier diagrams
>on the sonic server. It's all there in simple english...

You can call them linearity detectors as many times as you want, but
it won't change the fact that those 'linearity detectors' are nothing
more than amplitude comparators used for ALC circuits.

>Passive Gain Operation: Pentode and tetrode grids in grounded grid
>amplifiers operation which contribute no active signal gain ,

Then why even call it "passive gain"? Why not just call them
"passive"? Because you goofed and you now have to defend your mistakes
with even more ignorance, that's why.

> but by their
>physical location and construction act as an electrostatic shield between
>the grid and plate...

They do the exact same thing in a common-cathode amp.

> of course that includes the consequence that the
>pesty grid to plate capacitance is reduced.

LOL!

>Traditional Potentials: In a grounded grid sweep tube amplifier... HV on the
>
>anode, a negative low impedance dc bias supply for #1 control grid.

Are you forgetting about the Dentron? The grid is grounded and the
cathode is biased positive. Is that 'non-traditional'? What about the
KLV which has the control grid tied to the cathode and the screen is
pulled negative? Is that 'non-traditional'? Can a 'non-traditional'
amp be better than a 'traditional' amp? Who decides what is
'traditional' and what is not? Or what is better or worse? You?

>Beam Power Application: Not sure where your going with it... but in my
>opinion, Sweep Beam Power tubes can make really nice, modest power
>level linear rf amplifiers. The best you can do is to agree to disagree.

It was your terminology. If you can't explain it then you can't
explain it. At least it's better to admit that you can't explain it
than to make up some stupid definition like you did with your other
bogus catch-phrases.

>Low Mu to designate a triode connected sweep tube... sure: All three
>grids tied to both dc and signal ground... A previously seen and
>elsewhere applied layout scheme which can lead to dangerous values
>of grid and or screen current.

Like the Dentron? LOL! And the grids don't need to be tied to DC
ground to be grounded -- just a signal ground will do. Maybe you
should read that Electronics 101 book real soon...

>Compared to many triode grounded grid AB2 amplifiers, the sweep
>tubes grounded grids screening or shielding action and consequential
>reduced grid to plate capacitance give it pretty good VHF stability.

Right effect, wrong reasons.

>In the VHF (parasitic problem) region, triodes with significant "hot" VHF
>gain operate have increased circuit stability concerns when compared to
>a grounded grid tetrode or pentode. Amplifiers such as the Kenwood
>TL-922 were pulled from the market for just such reasons although they'll
>never admit it.

Cute how you slipped in that "they'll never admit it" part.

>> Who's the one lacking in RF theory and experience, Skippy? It ain't
>> me, that's for DAMN sure!
>
>Still got your potty mouth Frank...

Which, even when added to my own conceit, isn't half as bad as your
snotty, arrogant and half-witted attempts at belittlement, "Buck-o"!

> nothing we can do about it here
>except scold you about it. Anyway, enjoy your crow... and I hope the
>cabernet was the proper year.
>
>Get some newer books, the ones your using in your posts are dated
>as is your actual knowledge of rf amplifiers. Maybe next time...

Get some smarts and use logic instead of half-assed assumptions; get
some facts instead of trying to sell your uninformed opinions; and
most of all, get cracking on those books -- you have a lot of catching
up to do for all those classes you skipped because you thought you
were too smart for the lecture.

So now, how far you want to take this little discussion?

I don't operate in the freeband area. I have no interest in chasing DX.
My only DX experiences with the freeband date back to 2 sunspot cycles
ago. Any other time, the freeband was used as a temporary "escape
channel" for us locals to get away from idiots throwing carriers or some
other such nonsense on the legal 40. I don't operate much at all on CB,
as most of the decent locals have either been chased away by the almost
constant droning of the skip noise, or have found other interests. I'm
mainly on the ham bands now.

Even if he had a standard 1/4 wave whip on the bumper, he's still going to get some reflected signal back into the antenna. Probably not as much as with the K40, but it would definitely throw the SWR readings off.

Went in a CB shop Monday. Lots of 100+ watt rigs for sale many
of them on display tuned to frequencies in the 10M band. No
surprise except for the arrogance. Took a bunch of digital
pictures to forward to the FCC field office. I don't suppose
it will do any good but I did my part.

Hi Frank,
Back so soon.. hope your blood pressure is still under control.

> (a) A grant of equipment authorization is valid only when the FCC
> Identifier is permanently affixed on the device and remains effective
> until revoked or withdrawn, rescinded, surrendered, or a termination
> date is otherwise established by the Commission.

The Motorola amplifiers I have here (and mentioned before) still have
their permanent tags and are still effective as originally sold.

> Now in case you have been in a cave the past few years, no amplifiers
> between 24 and 35 MHz are being granted authorization because of the
> following law:

That would be new authorization... the Motorola units I described
already have authorization.

> (b) After April 27, 1978, no person shall manufacture, sell or
> lease, offer for sale or lease (including advertising for sale or
> lease), or import, ship, or distribute for the purpose of selling or
> leasing or offering for sale or lease, any external radio frequency
> power amplifier or amplifier kit capable of operation on any frequency
> or frequencies between 24 and 35 MHz.

For new manufactured equipment, the motorola amplifiers are still valid,
made before the ban.

> Which means that any amplifier that can operate between 24 and 35 MHz
> has lost it's certification/type-acceptance.

As you try to interpret the rules to preexisting legal equipment. Not
the case in my interpretation of the rules.

> As for your query to the FCC about modification of your amps, you will
> find the answer here:

No modifications are/were required to place the mentioned amplifiers
into Same Radio Service.

Sorry, once again... you lose. Nice try Frankie...

> In case you are too lazy to read them yourself, they clearly state
> that you can't change the frequency range (and still use them under

Don't have too... they function exactly as designed without
modifications.

Maybe a change would do you good Frankie...

Which simply proves the FCC ULS system is not complete. That's about
all your going to get Frankie... The file number I posted is current
and your out of luck. "tough titty said the kitty..."

> >:> Hard copies are the bottom line frankie...
> Not if they can't be verified.

The paperwork in my hot little hand takes care of the FCC every time
they might ask for it.

> Not only did you provide an invalid file number, but you flat out lied
> about the IB service being current:

Don't think so Frankie... so what happens if I scan in an image of the
actual license, blank out the personal information so you can enjoy
your crow dinner. It won't work.. you'll claim the scan was modified
to include the IB service. Nothing makes you happy frankie, your just
a bad actor.

> http://www.fcc.gov/Bureaus/Wireless/Public_Notices/1997/da972216.html

> are just full of lies, aren't you Skippy?

Yep, as authorized by the FCC for the current hard copies I have in my
hand. Call us both liars Frankie... enjoy your crow dinner.

Aaaahhh.... I see your pivot point for your little rant... Well
bartender,

let me add one word in to give it proper text. There were some
"reported"
older televisions that used the 6146 tube as a horizontal oscillator.

See folks, get ahead of yourself typing and Frank carries it to his
grave
as the focal point of a rather useless thread.

Sweep tube is still a label... of which can be further detailed.. if
anyone but Frankie G wants to go there.

> no difference, and used your favorite buzzword "classic" to describe
> the sweep tube. I especially like your line, "Horizontal oscillator /
> amplifier was often the function of sweep and beam power tubes"
> because not only is it 100% redundant, it reinforces the fact that you
> didn't understand the definition of a 'beam' tube, either!

Yeah, I referenced that line right out of the RCA Receiving Tube Manual.
Call RCA redundant... and while your there.. have a look at some of the
multi section tubes which are not classic sweep tubes one would find in
a grounded grid rf amplifier. your text reinforces the evidence that
you
have little actual experience building rf amplifiers.

> >The orginal post gets you to dance on the sweep tube labels, not big deal
> >which was easily clarified. For some reason, you just love to go back to
> >the same non issue in any combination of text you can constuct... Get on
> >with something more worth while frankie... your banging your bald head

> >into the same non issue wall.

> Your technical ignorance is a very important issue, Skippy.

More important are your hazardous technical post statements which tell people to tie grids to plates in RF amplifiers... talk about technical ignorance and true evidence that you probably have built few, if any RF amplifiers.

> Call it whatever you want. The fact remains that the term "sweep tube"
> is applied to tubes used for television 'sweep' circuits. If you can
> find a TV that used the 8950 then I'll call it a sweep tube, too.

I do call it what I want... most people in the real RF world know sweep type tubes exist that are equivalent RF designed equivalents, never used in TV sweep or similar circuits.

We don't have a problem calling an equivalent tube by the same label, it fits and it works, the results are the same in the applied circuit. You are left out in the cold...

> So..... you think that a "CB" shop cannot sell and display Ham gear?
What
> law do you think was being broken? Reality Check indeed.............

Once again (and I cannot grasp why this is SO hard to understand), any radio
sold in the USA
actually has 2 (that's T W O) kinds of approval for sale; 1) FCC approval
to be sold stating that
the equipment in question meets FCC specifications for use in the intended
service. It applies to
commercially manufactured radios. 2) FCC certification for use in any
service other than Amateur.
Now, what that means is that, even though a radio MAY be intended for sale
by a manufacturer in
the Amateur Service, it STILL must be approved by FCC according to certain
criteria set up by FCC's own labs. Any OTHER radio marketed to OTHER
services must be FCC-approved, and
as a proof of said sale authority, have a sticker so stating that (para)
"This device meets all FCC re-
quirements for spectral purity according to Part XXX, Title 47, US
Code........................." Those
Galaxy, Connex, Magnum so-called "10 Meter" trash has NO such authority, no
such sticker, and
appear on a list of equipment (which I will once again post here in the
faint hope that you might grasp the reasons why said equipment cannot be
legally sold in the US) that has been determined by FCC's test labs NOT to
meet one or more of their test criteria. Without that approval, FCC can
most certainly raid, seize, and fine outlets that sell such equipment. Like
you, tools, some of those outlets themselves believe they have a "right" to
import and sell such junk, but they don't. It
is only a matter of time before the sh** hits the fan. .....and I
can't wait! Hehe!

BTW, today I was listening to 28.085 and it sounded just LIKE CB 19 complete
with echos, squeaks, and some driver saying F*** every other word describing
his dispatcher while sounding like he was talking down a drain pipe. Back
soon with the complete list.

> > So..... you think that a "CB" shop cannot sell and display Ham gear?
> What
> > law do you think was being broken? Reality Check indeed.....

This is the "law" that is broken by the sale of uncertified/approved
equipment.

It comes direct from FCC's web site.

ILLEGAL CB TRANSCEIVER LIST The FCC's Office of Engineer and Technology (OET) has evaluated the devices listed below and has concluded that these devices are not only amateur transceivers but can easily be altered for use as Citizens Band (CB) transceivers as well. As such, OET has further concluded that these devices cannot legally be imported or marketed within the United States for the reasons discussed below. Further, the FCC General Council has issued a decision in a specific case involving one manufacturer and has concluded that dual use CB and amateur radios of the kind at issue may not be approved under the Commission's rules and are in violation of several rules including the RF power level limits of 47 CFR 95.639. (letter from Christopher J. Wright, FCC-OGC to John F. Atwood, US Customs Service, dated May 17, 1999). Transceivers used in the Amateur Radio Service below 30 MHz do not require FCC authorization prior to being imported into or marketed within the United States, but transceivers for other services, including the CB Radio Service (CB), do require Commission approval. The transceivers listed herein and other similar models operate in the amateur "10-meter band" and are often referred to as "10-meter" radios or "export" radios. The amateur 10-meter band uses frequencies that are very close to the channels set aside for use in the CB service. Some of the transceivers that manufacturers call "10-meter" radios either operate on CB frequencies as manufactured and imported or are designed such that internal circuits can readily be activated by a user, a service technician or a dealer to operate on CB frequencies. According to Section 95.603(c) of the Commission's rules, a CB transmitter is a transmitter that operates or is intended to operate at a station authorized for the CB service. 47C.F.R. • 95.603(c). The Commission's equipment authorization experts in the FCC Laboratory have

determined that the transceivers listed herein and other similar models at issue here are intended for use on the CB frequencies as well as those in the amateur service because they have built-in capability to operate on CB frequencies. This capability can be readily activated by moving or removing a jumper plug, cutting or splicing a wire, plugging in a connector, or other simple means. Thus, all the transceivers listed herein and similar models fall within the definition of a CB transmitter. See 47C.F.R. ? 95.603(c). A CB transmitter must be certificated by the FCC prior to marketing or importation. 47 C.F.R. ?? 95.603(c); 2.803. Moreover, the dual use CB and amateur radios of the kind at issue here may not be certified under the Commission's rules. Section 95.655(a) states: "..([CB] Transmitters with frequency capability for the Amateur Radio Services . will not be certificated.)" See also Amendment of Part 95, Subpart E, Technical Regulations in the Personal Radio Services Rules, FCC 88-256, 1888 WL 488084 (August 17, 1988). This clarification was added to explicitly foreclose the possibility of certification of dual use CB and amateur radios, see id, and thereby deter use by CB operators of frequencies allocated for amateur radio use. In addition, the Commission's equipment authorization experts have determined that these devices violate or appear to violate a number of the rules governing CB devices. For example, they may use emission types not permitted, or emit RF power at a level in excess of the levels permitted in the CB radio service. See 47 C.F.R. ? 95.639. In view of the foregoing, the following "10-meter" transceivers are not acceptable for importation or marketing into/within the United States. Importation and marketing of these units is illegal pursuant to Section 302(b) of the Communications Act and Section 2.803 of the rules. Willful violations of the Rules and the Act may subject the violator to a monetary forfeiture of not more than $11,000 for each violation or each day of a continuing violation. The Commission continues to review this type of equipment, and additional makes and models may be added to this list in the future. LIST OF TRANSCEIVERS ILLEGAL TO IMPORT OR MARKET GALAXY - models: DX33HML, DX 44V, DX55V, DX66V, DX 73V, DX 77HML, DX 88HL, DX99V and Saturn Turbo CONNEX - models: 3300, 3300HP-ZX, 3300 PLUS and CX-3800 MIRAGE - models: 44, Galaxy 88, 9900 and 2950EX NORTH STAR - models: NS-3000 and NS-9000 PRESIDENT - models: Grant, J.F.K., Jackson and Lincoln PRO STAR - model: 240 RANGER - models: AR-3500 and RCI-2950 TEK - model: HR-3950 UNIDEN - models: HR-2510 and HR-2600 SUPER STAR - model: 121 For further information concerning the listed transceivers or similar models, contact Ray LaForge or Gary Hendrickson at the FCC Laboratory, 7435 Oakland Mills Road, Columbia, MD 21046, (301) 362-3041 or (301) 362-3043 respectively, or E-mail: rlaforge@fcc.gov

The topic was the application of Sweep Tubes in grounded grid
amplifiers. The specific issue is the multiple connection schemes
possible which would damage tetrode/pentodes in some triode
connection schemes. You don't appear to have knowledge of the
specific topic. Hi mu tubes don't play in all "low mu" grounded
grid amplifiers circuits.

> >In specific to my post, certain tubes operate as low mu in grounded grid

> still haven't been able to do that because you don't have a clue as to
> what you are talking about!

Not quite... no where above does it say triode connected sweep tube is
not operating as a triode. In specific... there is more than one
well known grounded grid circuit (which, how many and how the grids
are grounded). Some of the mentioned are bad news for people trying
to opearate sweep tubes as low mu triodes... or just plain trying to
operate sweep tubes as triodes.

Damaged tubes sourced to the wrong type of "triode connected" circuit
(using tetrodes and pentodes) is not really that funny to most people.

Ham radio is a toy...nothing more.

Then I ask you once again, sir, why is it that Amateur Radio is the one that
is called upon to augment communications resources in time of disaster? CB
is NOT. Why is it that Amateur Radio
has PRB-1 to assist hams in abating local zoning laws against antennas? CB
is NOT included.
Why is it that Amateurs are exempt from local scanner laws? CBers are NOT.
Why is is that
Amateurs are exempt from Local Enforcement (PL106-521)? CBers are the FOCUS
of said law.
Why is there now a Bill awaiting the 2003 session to exempt Amateurs from
neighborhood cove-nants? CBers get NO such protection. Why do hams enjoy
the use of spectrum from the bottom
to the "top"? CBers are legally restricted to 40 channels. Toy? yes. CB
a toy? yes. But Amateur
Radio enjoys a FAR higher rung on the ladder when it comes to Congress and
emergency services
organizations. CB is NOT vital to trucking. The same thing can be done on
VHF or UHF. You just don't want your ability to interfere with adjacent
services curtailed and your precious "skip" to
be taken away!

NONE of your quotes have >EVER been modified, misquoted, pulled out of >context, edited (not even for spelling), or >otherwise used for any other purpose except >for the meaning you intended. All my posts are >on google, and I challenge you to find even >ONE example that backs up your claim. >Otherwise, quit lying about being misquoted.

This is rich. Frank, you have done (misquoted, cut and paste, misdirected, lied, deliberately taken things out of context) this with every single person who has ever had degrees of success debating you. To claim otherwise...well.....just needed pointed out.

From: me@myaddress.net (Cowering Nocode)
>Went in a CB shop Monday. Lots of 100+ watt >rigs for sale many of them
on display tuned to >frequencies in the 10M band.

Yea,,,that's to remind you nocodes that are always messing around cb
shops that you too, can operate on the ten meter band, with an upgrade.
Maybe it's too tough?

>No surprise except for the arrogance.<

It was evident from your first sentence.

>Took a bunch of digital pictures to forward to >the FCC field office.

Did you clean yourself off afterwards or did you ride the bus all the
way home with the front of your pants stained?

> I don't suppose it will do any good but I did >my part.

Is that what you went in there for? Hoping to find something you
interpret as illegal? Hahahhaha! If you had any real hopes of
accompishing anything, you would upgrade.

> don't require neutralization).

Now "where exactly did I say reverse screen current is a factor..?"
That statement seems to be missing from the original and your cut and
pasted text. Stop making stuff up as you go along Franklin..

If you properly read the text, I was staying true to the actual
subject of the moment... tetrodes and pentodes in g-grid circuits.
One of the major reasons grounded grid circuits using tetrodes and
pentodes don't often require neutralization. The statement still
stands...

> First, as I have said many times but you fail to seek the truth for
> yourself, neutralization is not required in a grounded-grid amp
> because it's a non-inverting amp.

The Non Inverting circuit is not the key, nor is it the dominant
factor of a grounded grid amplifier.

> Second, grid shielding means absolutely nothing in a grounded-grid
> amplifier -- if it did, then your input signal would never get past
> the grid to the plate!

Not true, you are wrong.

> Third, Cgp never changes because it's a characteristic of the tube,
> not the circuit. The capacitance AT the grid can change by changing
> the circuit, but that's the INPUT capacitance, NOT Cgp! I have said
> that many times as well, and just like every other fact, you have
> failed to verify it for yourself.

You keep jumping back to the tube Cgp when the topic was the actual
problem C of the common cathode circuit C, much reduced grounded grid
circuit which is halved. Don't mix them up frankie... go back and
read my text as its writen. If you don't belive me, reference
the many Radio Handbook texts by former Eimac Author Bill Orr
(rip sk).

> >You said it doesn't even exist... I called you on your statement to

You chose to read the post!
It appears YOU are the only one cryin' here.
So, don't you start cryin' about it, either.

Your response humours me.
Only YOU responded to humiliate me;
the result will be the "DELETE" key,
and will result in your downfall.

You do not carry yourself very well as a CB'er by attacking others with
meaningless responses to THE TRUTH!!
I have a word count of only 9 words and two letters in your response
What more do you really need to say to begin with, at all?
Why do hide behind the letters FU to make your point?
Don't stress yourself guy.
You'll be alright!
Ain't no biggie!
Don't cry, now!

See the general description of Beam Forming Plates Frankie... thats
what I'm talking about... and what I was talking about in the first
post.

> > A more serious directly
> >related issue with beam power tube missing from your post is any
> >mention of electrode spacing. Electrode spacing is a serious property of
> >the beam tubes. Somehow you've totally left that out of your posts... but

> are located directly behind the wires of the grid forming an electron

It's clear as its writen, electrode spacing, not grid element or grid
wire spacing. But you left it out of your posts so using your tatics
we must now assume you know nothing about it.

> 'beam'? Sorry, Skippy, I already covered all that. But there are
> frequent examples where you use the terms 'beam' and 'power'
> interchageably, demonstrating that you didn't know what makes a beam
> tube different than any other power tube. Especially when you use
> phrases like "beam power applications". LOL!

Actually, its more like special beam forming plates (NOT THE GRID
WIRE SPACING OR PLACEMENT) found in beam power tubes, often used
in Sweep tube rf amplifiers. You have not mentioned before so we
must again assume you don't know anything about them.

>Then I ask you once again, sir, why is it that >Amateur Radio is the one that is called upon >to augment communications resources in time >of disaster? CB is NOT.

He never claimed it was. In all fairness, there are more aspects of hammie radio that equate the "hobby" side as opposed to the "necessity" side.

>Why is it that Amateur Radio
>has PRB-1 to assist hams in abating local >zoning laws against antennas?

Money. If cbers still needed licenses, you may darn well see that rule extended to them...especially those with real purpose. And Jerry, there exist several very important uses of cb radio across the land, not just with truckers, either.

>CB is NOT included. <

He never claimed otherwise.

>Why is it that Amateurs are exempt from local >scanner laws?

See above...money.

> CBers are NOT. Why is is that<

Again,,see above.

>Amateurs are exempt from Local Enforcement >(PL106-521)? CBers are the FOCUS
>of said law.

Wanna bet? Not if they are guilty of malicious, interference pal. Case in point...look at the goof in California (hammie) busting in on cops.....he was smacked by the feds AND the state.

>Why is there now a Bill awaiting the 2003 >session to exempt Amateurs from >neighborhood cove-nants?

$$$$$

>CBers get NO such protection. <

Sure they do. They get a hammie license. Hahahahahahahhahaha! Having a hammie license doesn't exempt one from being a cber.

>Why do hams enjoy the use of spectrum from >the bottom
>to the "top"?

They don't.
Nocodes are the first example, and hammies such as Dave Hall with his noted disdain for dx is the second.

>CBers are legally restricted to 40 channels.

Who claimed otherwise?

>Toy? yes. CB a toy? yes. But Amateur
>Radio enjoys a FAR higher rung on the ladder >when it comes to Congress and emergency >services
>organizations.

As you have been witness to firsthand, the lowest rung on the ladder of evolution has been shown to be held by several that have their "ticket".

> CB is NOT vital to trucking. <

The hell its not. Nothing, and I mean nothing is more dependable when a traffic accident just occured and alternate routes are needed.

>The same thing can be done on VHF or UHF.

Wrong. Those freqs are dead compared to 19
on the interstates.

>You just don't want your ability to interfere with >adjacent services curtailed and your precious >"skip" to be taken away!
>J

You really have a problem with cb.
We aren't worried about anything. Trust me on this.

Dumb answer Franklin... Sweep Tubes in grounded grid AB2 RF amps
can work very well. ... and I saved all that money just by knowing
the "feed through power" of a grounded grid circuit swamps out the
grid current distortion issues.

But you didn't...

Much to your dismay frankie, I have quite the formal electronics
education thank you. At no time did I ever restrict AB2 operation to
grounded grid... homey ain't playing that word game with you.

Once more for the road... we've been talking sweep tubes in AB2
grounded grid amplifiers. You want to jump lanes to common cathode
circuits, tell us at the time. I've been calling you on that issue
for some time now.

Just as a side bar comment, not all common cathode amps require
neutralization. Its not rocket science to build a stable common
cathode amplifier less the neutralization requirement.

Unless you put on the the turn signal... we are talking grounded
grid AB2 amplifiers using sweep tubes. Now if we can just get
you off your cell phone.

> > The original topic is

> in many common-cathode applications.

Doesn't look your your going to be happy with any 25-50Mhz amplifier
example, the fact that I have an unaltered copy of an current IB
Radio Service FCC License so I can't help you there, nor do I care

to.

If you want to put on the common cathode sweep tube amplifier talk, lets boogie. By the way, did I tell you I have a two tube common cathode sweep tube amplifiers at 28.55 MHz that has better than 10dB gain and no neutralization...? How about you throwing out a circuit now..? How about you answering up with any text you've posted any where on the net that we can review... of course other than your hate post followup replies. Anything ...? Please..?

I'll be waiting..

Well, Truck drivers hang out - at truckstops tryin' to pick-up young gals/waitresses to "take them away from all that".
(Yeah - I've heard that line before!)
It don't mean shit!
They need to mind their own damn business and stop messin with someone's wife or girlfriend before they get hurt financially, mentally, emotionally and socially!!

Some wait for "lot-lizards" and "good-buddies" to come a knockin to get the cab rockin'!
They leave a message on the wall for someone to meet at certain time for whatever!!
Just for the hell of it -- change the date and location like at someone's house.

That's the shit right there!!
'Cause someone come out to beat they ass trying to make off with their daughter(s)!!
I can see that shit now!!

Then they will mind theys own bizwax!!
'specially thems black truckers!
They always wanna pick up da white gal!
you know what gonna happen then.
She gonna go wit him!!!
That's sad!! That's sad!!
The white gal betrayins her race in front of all those white folks just to get her butt fucked by some blackey!

So, whens was the last time you sees a black girl leave with a white truck driver who just picked her up?
Like I ask, :"What In The Hell Is The World Comin' Too?"

Y'all come back now, ya hear?!

You are quoting and talking ancient history.

MURS is here to stay - as a Unlicensed Public Service with digital
communications and removable/external high-gain antennas.

And, BTW, it wasn't just Motorola that didn't want repeaters on MURS.

My god, we agree on something... The short answer is... depends on what model Dentron GLA-1000 your talking about. From what I understand Late versions of the plain and all B versions included tuned input. The reincarnation of Dentron as Amp Supply had tuned input in all their sweep tube amplifiers.

Palomar had tuned input, depending on what model and version amp your talking about. Hi power mode of the 300 (six tube) model I like to reference has tuned input. Low power mode is direct to the final Quartet which has no tuned input. One should include a tuned input when driving with solid state exciters. It would not be required in common tube final HF Radios.

> lower power levels than high power peaks.

The conduction angle is never perfect, but it is still about 210 degrees by generic definition. The grid should be biased negative with respect to the cathode. The question should be if you've ever measured the noise..? Is the noise a significant problem ..? I and other believe it does not disqualify sweep tubes from RF AB2 g-grid amplifier service.

> > The big picture here is the grid current

> The Dentron claims -30 dB IMD and -40 dB on harmonics, which sucks for
> a kilowatt amplifier.

Probably because -30 dB was the requirement... In my Dentron web page text, I mention a lot of the short comings of Dentron, which then became Amp Supply. I don't judge the Dentron GLA-1000 as a good circuit, in fact I wrote my text to point out some serious improvements to be made which will make the amplifier a great rebuild project.

Even the Svetlana Conversion has a lot of poop and is actually incomplete (no standby mode cut-off).

I measured about -32 dB on one example Quartet Sweep Tube Amplifier some years back. What would make the amplifier "suck" is a speech processed SSB signal using ALC.

In regular operation, you couldn't tell I had it on the air, other than the increased signal strength. That's what amplifier operation should be all about.

Now there you go again trying to drag Reverse Screen Current into the
mix; trying to cover your tracks... nope, won't work here.

Let us filter through the confetti and get right back on the topic.

The doesn't work like a triode refers to the benefit of the additional
shielding from the grounded screen and supressor grids. To make the
round trip, I also claim that the type of AB2 grounded grid circuit
is of concern (as there are a few variations of grounded grid) when
using triode connected grounded grid sweep tubes because there is a
problem (previously explained) trying to run them in some applied
triode g-grid circuits. It's all about the tube geometry...

> You do know what a 'load line' is, don't you Skippy?

I do thank you, you don't appear to have a grasp of load lines when
you write poop about my 10 ohm series cathode resistor recommendation
in the dentron text.

The AC & DC part came in a later post... grounding grids in various
combinations was mentioned well over a year ago. I even posted a
rather large article about the good sweep tube amplifier layouts.
Since your so good at news group surfing, go dig it up on the
www.contesting.com web page. Once again, how about sharing any
text or web pages you have with us Frank... we're still waiting.

> thing you accuse ME of doing.

In specific, you applied the resistor recommendation to a fault of ungrounding the cathode, you also threw in neutralization with your diatribe of the moment when I only state the resistor improves linearity, the cause... by providing degeneration. You did not properly address the issue because you don't understand AB2 grounded grid circuits very well.

indeed..... "

>Once again (and I cannot grasp why this is SO >hard to understand),

Me neither, but I'm gonna try and walk you through it again.

>any radio sold in the USA
>actually has 2 (that's T W O) kinds of approval >for sale; 1) FCC
approval to be sold stating >that
>the equipment in question meets FCC >specifications for use in the
intended service. >It applies to
>commercially manufactured radios. 2) FCC >certification for use in any
service other than >Amateur.
>Now, what that means is that, even though a >radio MAY be intended for
sale by a >manufacturer in
>the Amateur Service, it STILL must be >approved by FCC according to
certain criteria >set up by FCC's own labs.

When you say "certified" and "approval" are you referring to "type
acceptance"? If you are, since when did amateur gear need type
acceptance? If you are not referring to such, then what ARE you
referring to?

The term "type acceptance" is not used any more. If you will notice, when
you see a new Yaesu,
Icom, or Kenwood Amateur transceiver about to be introduced, you will see a
small disclaimer down at the bottom of the ad that says, "has not received
FCC approval for sale to the public"--or
something to that affect. Regardless of what service a radio is targeted
towards, it must meet certain requirements set by FCC for commercial
manufacturers in order to be approved for sale
in that particular service. While there is no "type certificate" for
Amateur Radios, commercially
produced radios for that market must meet certain baseline requirements
before the Fed will allow
it to be imported/sold in the US. That is the "rub" with those alleged 10
Meter "ham" radios sold in
truck stops; they do not meet FCC's criteria, they are too easy to modify,
they have "band" switches which allow the radio to cover SEVERAL "bands" of

frequencies. Ten Meters is O N E
band, so a 10 Meter radio doesn't NEED switches to cover one band. Ten
Meter ham radios,
the REAL ones, don't have incremental "channel" positions or echo, or even
those banal squeaks
and beeps.

>Any OTHER radio marketed to OTHER >services must be FCC-approved, and
>as a proof of said sale authority, have a sticker >so stating that
(para) "This device meets all >FCC re-
>quirements for spectral purity according to >Part XXX, Title 47, US
Code....."

So. Manufacturers were never mentioned. The 100 watt radios could have
been Icoms for all you know.

Icoms sold in the domestic market have the required approval for sale;
Galaxy's do not.

>Those
>Galaxy, Connex, Magnum so-called "10 >Meter" trash has NO such
authority, no such >sticker, and
>appear on a list of equipment (which I will >once again post here in

.....and I can't wait! Hehe!

Hey, the cb shop can be owned by a licensed ham and cater to cb. Dave
Hall N3CVJ did it with his hack shop. Mods and all.
The cb shop could legally sell Icons, Yaesu, etc. See, many hammies do
cb work,,,more cash than in hammie stuff, especially if you get a good
name among drivers...tin' fo' good buddy?

He still may NOT legally sell those radios that appear on the list.
Legally, he can
sell the regular ham radios to anyone. Me, I wouldn't sell one without
proof of license.
Legal is legal, illegal is illegal, no matter WHAT "license" one has.

> > controls the bias regulator -- it's an ALC circuit, Skippy!

Lets break it down frankie... Conventional ALC as found in many
Amateur transceivers used with rf amplifiers consist of a hard wired
"feed back loop". The amplifier output quantity is sampled and
fed back to the transmitter ALC circuit. The Transmitter output
in real world action hopefully reacts (but never in time) to reduce
excessive drive. There is always a measurable amount of poop going
out the door before the circuit reacts. In a compressed speech
chat, poop is in generate mode because the ALC cannot keep up.
i.e. time constants.

In another topic we could talk about how to deal with the loop
issue in the real world, but its not worth the trouble when a
properly set up radio with a real power control (not a mic gain)
can easily limit the drive.

The Galaxy circuit is novel in that it adjusts the amplifier bias
for improved linearity. Notice the detector circuit compares the
output with the input. There is no limiting action... just
bias adjustment.

> The acronym 'ALC' stands for Automatic Level Control which, for all
> intents and purposes, is a compressor. The ALC is a circuit that
> reduces the input or gain when the amplifier becomes overloaded. By
> comparison, a limiter is basically a clipper, which necessarily causes
> distortion.

If the input power reduction happens late, poop happens early. With
each new word in some cases... I'll hear you up the band with your
"contest audio." Who's the bad boy now..?

The power control knob of a modern amateur radio should not accused
of causing distortion. In fact it could be a poop gate if people
would learn how to use it with their amplifiers in operation.

> As far as their being too "slow", most of them begin to react after
> the very first or second RF peak. I suppose a couple peaks are going
> to sneak through before the output level is reduced, but that's a
> whole lot better than each every RF peak being clipped from a limiter.

Most modern amateur speech processors are not limiters. A couple
of peaks are going to sneak through each time the ALC loop fails
to keep up. Poop generation in every transmission.

> >Many Amateurs using ALC are clueless about the actual
> > circuit operation.
>
> Yourself included.

Thanks, seems I brought it to your attention, but you knew that
of course.

> >Before the ALC acts (time constant)... unwanted poop is piped out the

> even at normal signal levels, just as if the amplifier were being
> driven into saturation. That's why RF limiters are not used in power
> amplifers, but ALC circuits are used instead.

Depending on ALC action most often results in over driven amplifiers,
dat's da fact jack...

RF Limiters are another animal which cover a lot of ground. Without
you going off to never never land again... how about you first read
and understand how the power control knob on a modern amateur radio
actually works...

Controlling or limiting the output power of a modern amateur radio is
not the distortion generation device your trying to describe....
really frankie, read up on it before you comment please.

> >: you claimed had "linearity detectors". You also claimed that ALC
> >: circuits are "dated technology" despite their continued and effective
> >: use in amplifiers and other circuits.
> >

> >At one time, ALC was thought to work pretty well for the most part.
>
> It still does.

For those who know no better and are happy with dated technology.
Modern radios do a better job with ALC, but it's never fast enough.
This is where the power control knob on the radio works better.

> >Relying on it for rf compression is poorly applied technology. If you
> >were to look at your signal before the ALC acts... much unwanted poop is

>
> The 'compression' to which you refer is actually CLIPPING of the audio
> peaks to prevent the amplifier from being driven into saturation on
> those peaks. It's funny how you got 'clipping' and 'compression'
> reversed!

When the amplifier reaches max boogie, the rf envelope is compressed
or in another view "hard limited". This is very bad news... some RF
Amplifiers have specified "X-dB" compression point measurement
values listed. The bottom line, one should avoid depending on
any circuit operation which can over drive an amplifier, even for
brief moments in each transmission. Smart people do not rely on
ALC circuit operation.

But you do...

It claims a lot of unsliced bologna Frank...glad you noticed. The
reason Amp Supply and Dentron went away was from their notorious
and now famous amount of monkey business.

1000 watts maybe on a good day with a tail wind...

Following most of the generic amplifier testing methods, I would imagine
they used a two tone test method.

In the real world, the GLA-1000 and Amp Supply LA-1000 do a nice clean
+10dB with about 40 to 60 watts drive. It makes them useful as compact
desktop amplifiers for many of the typical 70's/80's/90 hf amateur
radios.

> > They are FCC legal amplifiers which is all that matters.
>
> ONLY because of the exemption, NOT because of the RF performance of
> the sweep tubes, which basically sucks.

I was told, one version of the Amp Supply LA-1000 or the Dentron
GLA-1000C actually had type acceptance. I even had the tag picture
saved for the sonic web pages. Alas I'm not able to find it right
now so you'll accuse me of being a liar... so forget about it.

The big deal that the Dentron GLA-1000C and I believe the
Amp Supply LA-1000 models were both post ban amplifiers legally
sold in the US.

>
> > The FCC said go and the various mfgrs legally built them.

> And after they learned from their mistake they changed the rules.

Sweep tube amplifiers were legally made by Ameritron, Dentron
and Amp Supply after the 78 rule change... just not shipped with
plug and play 10 meter operation.

>

"Failed" ...?
Why would I need to mention it..? I've been talking about sweep
tubes, where have you been...?

Variety is the spice of life.... even Handbook projects using RF
power tubes are not specific to one single type of valve.

Life goes on...

Aaaaahhhhhh.......! Now your changing your tune to "high-frequency parasitics". Doesn't matter really, let's talk.

Well Mr. Amplifier... your on your face again... Much of the problem with amplifiers parasitics happen in the VHF region, an area you should never ignore and a simple parasitic suppressor is only a very small part of the big picture.

Tubes like the 8877 are well designed and for the most part, don't require parasitic suppressors to operate in a good high gain HF circuits. Pop in a similar size valve in the same circuit and chances are it's going to sing like a big dog.

The type of tube matters... don't know how to say it any clearer to you.

Your "predisposition to parasitics" is not really a good term... but the tubes such as the 3-1000z and the 3-500z in mfgrs rated applications have a well known and documented track record of parasitic problems. Readers can reference text at http://www.vcnet.com/measures for more detailed information.

For more detailed study of a tube which is not generically subject to parasitic problems, please research the 8877, in specific... the grid construction. The mfgrs data sheet might be a good place to start.

Your simply wrong again Franklin... or frankie...

cheers

Depends on where the noise floor happens to be... you have to be
certain
that each or most of the receivers can actually hear the noise floor.
You can't be certain...

> So you see, it wasn't such a "broad" statement at all. My statement is

> noise louder.

I don't agree... neither does most of the rest of the world. That's
why much of the rest of the world uses them in weak signal work.
That includes many two way commercial receivers along with the hobby
crowd. It's also how all those companies make much of their bread
and butter.

The shielding of the grid(s) is part of the picture, but at no time
did I claim it to be the entire picture. Lets get real here frankie...
The non inverting function of the g-grid amplifier is not the key
player in the picture of amplifier stability. Non inverting amplifiers
will easily sing, it's about that anode-C path through the
blocking cap to the Tune-C that really concern the tubes gain in
the VHF region... your wonderful 6146 example can also boogie with
the rest of the tube that have VHF gain.

But you have "yeti" to show us that you understand the VHF issues
of HF amplifiers and how to deal with them.... oh yeah, other than
"a simple parasitic suppressor". You build and amplifier with a tube
like the 3-1000z and "a simple parasitic suppressor doesn't cut the
mustard frankie. And it's a purpose designed RF power tube...

>
> >: the voltages on the input and output are in phase, and therefore cause

> regenerative feedback from turning the amplifier into an oscillator on
> the resonant frequency of the amplifier! By golly, you don't even know

> how an oscillator works! Talk about bogus...!

Neutralization in the HF region goes out the window to ensure stability in the vhf region. There are two different paths happening...

By golly I must know something... every single grounded grid amplifier I own or have built (which are many in number) does not have one part of a neutralization circuit on board.

No one here claims neutralization is used to prevent parasitics. But most all of us owning or building grounded grid amplifiers (with the exception of some much debated Ameritron circuits) don't have a lick of a neutralization circuit installed.

Why wasted the hardware, it's simply not required in most grounded grid amplifier designs. Of course unless you and _____ say it is.

"Jerry Oxendine" <joxendi@bellsouth.net> wrote in message
news:c0SA9.16347$wO4.6939@news.bellsouth.net...
:
: This is the "law" that is broken by the sale of uncertified/approved
: equipment.
:
: It comes direct from FCC's web site.
:
:
: ---
--
: ----
:
:
:
:
:
: ILLEGAL CB TRANSCEIVER LIST The FCC's Office of Engineer and Technology
: (OET) has evaluated the devices listed below and has concluded that these
: devices are not only amateur transceivers but can easily be altered for
use
: as Citizens Band (CB) transceivers as well. As such, OET has further
: concluded that these devices cannot legally be imported or marketed within
: the United States for the reasons discussed below. Further, the FCC
General
: Council has issued a decision in a specific case involving one
manufacturer
: and has concluded that dual use CB and amateur radios of the kind at issue
: may not be approved under the Commission's rules and are in violation of
: several rules including the RF power level limits of 47 CFR 95.639.
(letter
: from Christopher J. Wright, FCC-OGC to John F. Atwood, US Customs Service,
: dated May 17, 1999). Transceivers used in the Amateur Radio Service below
30
: MHz do not require FCC authorization prior to being imported into or
: marketed within the United States, but transceivers for other services,
: including the CB Radio Service (CB), do require Commission approval. The
: transceivers listed herein and other similar models operate in the amateur
: "10-meter band" and are often referred to as "10-meter" radios or "export"

: radios. The amateur 10-meter band uses frequencies that are very close to
: the channels set aside for use in the CB service. Some of the transceivers
: that manufacturers call "10-meter" radios either operate on CB frequencies
: as manufactured and imported or are designed such that internal circuits
can
: readily be activated by a user, a service technician or a dealer to
operate
: on CB frequencies. According to Section 95.603(c) of the Commission's
rules,
: a CB transmitter is a transmitter that operates or is intended to operate
at
: a station authorized for the CB service. 47C.F.R. &#65533; 95.603(c). The
: Commission's equipment authorization experts in the FCC Laboratory have
: determined that the transceivers listed herein and other similar models at
: issue here are intended for use on the CB frequencies as well as those in
: the amateur service because they have built-in capability to operate on CB
: frequencies. This capability can be readily activated by moving or
removing
: a jumper plug, cutting or splicing a wire, plugging in a connector, or
other
: simple means. Thus, all the transceivers listed herein and similar models
: fall within the definition of a CB transmitter. See 47C.F.R. &#65533; 95.603(c).
A
: CB transmitter must be certificated by the FCC prior to marketing or
: importation. 47 C.F.R. &#65533;&#65533; 95.603(c); 2.803. Moreover, the dual use CB and
: amateur radios of the kind at issue here may not be certified under the
: Commission's rules. Section 95.655(a) states: "..([CB] Transmitters with
: frequency capability for the Amateur Radio Services . will not be
: certificated.)" See also Amendment of Part 95, Subpart E, Technical
: Regulations in the Personal Radio Services Rules, FCC 88-256, 1888 WL
488084
: (August 17, 1988). This clarification was added to explicitly foreclose
the
: possibility of certification of dual use CB and amateur radios, see id,
and
: thereby deter use by CB operators of frequencies allocated for amateur
radio
: use. In addition, the Commission's equipment authorization experts have
: determined that these devices violate or appear to violate a number of the
: rules governing CB devices. For example, they may use emission types not
: permitted, or emit RF power at a level in excess of the levels permitted
in
: the CB radio service. See 47 C.F.R. &#65533; 95.639. In view of the foregoing,
the
: following "10-meter" transceivers are not acceptable for importation or

Well then, let's "concept them frankie... onward.
>
> 1. The screen grid does indeed shield the control grid from the plate,
> but it does so ONLY when there is a signal on the grid to be shielded.
> You don't have a signal on the grid of a grounded-grid amplifier.

You have reduced Cgp and Ccp... the reduced Cgp is a big
picture benefit of a grounded grid amplifiers. But you knew that
of course..
Simple enough, next

> 2. The effect of adding a screen grid to a TRIODE reduces the
> grid-to-plate capacitance of the tube. The Cgp of a tube DOES NOT
> CHANGE because it's connected as a triode in a grounded-grid
> amplifier! In fact, it effectively does the opposite....

Careful what you write bucky... The Cgp is actually about
half as I describe. I, other people and a heck of a lot of text
books don't agree. You are simply wrong and need to go look up
the details. How about a Radio Handbook as a good reference...

> 3. Since your sweep tube is connected as a triode, the screen and

> so suprising since the tube is connected and operated as a TRIODE)!

Aaaaaaahhhhh, see... this is where you don't know classic grounded
grid amplifier layouts very well. It is very bad news to ground
the G1, G2 and G3 grids together... and you don't even have a clue
why...

I'll put aside your Cgp statements for the moment until you review
and understand why one should not ground together the G1, G2 (and G3)
grids with many types of tubes, based on their geometry. That includes
rf power tubes like the 4cx250b.

Your plane just crashed frankie...

> 4. I don't know how many times I need to repeat this before you

> regenerative feedback requiring neutralization -- NOT because of
> reduced Cgp or 'grid shielding', which are properties of the tube
> regardless of whether it's used as a grounded-grid or common-cathode
> amplifier.

In the ideal dream world... in the real world, feedback paths can
and do occur within the max (Ft) of the tube. When you have VHF (Ft)
rated tubes in service, all bets are off when relying on the non
inverting HF circuit layout. The non inverting by layout operation

of an amplifier makes it only a card player, not the dealer.

When you have tubes with high vhf gain, there can be two dealers
to the card game.

The subject is well covered at http://www.vcnet.com/measures

Don't take my or Frankie's word for it... grab some Radio Handbooks
and review the web page text mentioned above.

You'll grow old waiting for Frank to post any articles of text
he's authored. Even though I said please numerous times.

:
: Tom

Well Tom, he has a van with a fiberglass roof what a mag mount is out of the question, a base loaded coil on the bumper is like a dummy load, he should be able to put a 102" whip and a spring on the bumper and get decent results. I will sure beat what he has now. Just about every antenna has some reflected power, a swr of 2:1 or less will be satisfactory and i think he can get it lower than that anyhow. If not a small matching network could be built if he wanted to get queer about it.

: Why not? The K-40 whip is what 72"

Well for starters thats not the point the K40 load for 1 may be bad, for 2 it has a coil and you cab't just put the 102" whip in there and expect to get a good match. he point was to remove the k40 which is a base load and get something longer with no coil behind all the metal of the van.

Temper temper Frankie... your bald head and your blood pressure are
growing.

So how about answering my questions... how many grounded grid
amplifiers have you seen in operation...? make and model..?
any..?

> > The predominant class of grounded grid
> >amplifiers is AB2... exciter power is required and a portion shows up in
> >the output as a freebie. Doesn't get any simpler, but you seen to want to

> when grid current flows. You are very, very wrong, Skippy. ANY class

Grid current flow implies input drive power consumed... unless you have
that magical grounded grid AB1 amplifier make and model handy...?

> of grounded-grid amplifier consumes input power (meaning power from
> the signal source). The input is on the cathode, and it is impossible

> statements before you demonstrate your ignorance even further by
> continuing to defend them.

Still waiting for that AB1 grounded grid amplifier Frank, make and model when you have a moment.

Keep this handy because it's helpful when talking about grounded grid amplifiers.

AB2 operation, grid current flows, drive power is consumed. The feed through drive power swamps out the grid current distortion issues.

AB1, no grid current flow.

Back latter for number 18 ... gotta' go check my reverse screen current.

still love ya frankie...

FMRNYCER,
There's nothing wrong with the antenna. The problem is where
it's mounted. No antenna works well if it's 'obscured' by near
by objects (metal). If you could move it to the top of the
vehicle
it would work much better, or at least tune correctly. I can
understand why that may not be possible, or that you may not want
to move it, but that's what will help the most...
'Doc

1436. Re: Browning Eagle Question

Newsgroup: rec.radio.cb

Message-ID: <fsl8tug9676ohjtulb5q7mqj89b181ogur@4ax.com>
Source record: 144020

Not exactly the same; the 4A used a special EPROM and synth. circuit
for expanded channel coverage. The main TX & RX circuits were similar.

We SELL photocopies of either the Mark 4 or Mark 4A (original Browning
books) for $20 postpaid if interested. Each book was about 50-70
pages plus two 11x17 inch schematics.

THAT is the attraction of Amateur Radio; the experimentation and building.
And there is room to
get away from the things one doesn't like. "Cool" mods? Most of the
so-called mods for CB are
illegal and cause interference to other CBers or adjacent services.

Troll Post.

Landshark

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

Wrong, and you would see that in the part of the post you snipped.
Here, let me quote it for you:

>Sec. 2.939 Revocation or withdrawal of equipment authorization.

> (a) The Commission may revoke any equipment authorization:
> ....
> (4) Because of conditions coming to the attention of the
>Commission which would warrant it in refusing to grant an original
>application.

There. Notice the part about "conditions...which would warrant [the
FCC] in refusing to grant an original application". In case you don't
have enough brains to figure that out, it means if the equipment
wouldn't get type-accepted/certificated TODAY then the original
type-acceptance/certification has effectively been RESCINDED.

>> Now in case you have been in a cave the past few years, no amplifiers
>> between 24 and 35 MHz are being granted authorization because of the
>> following law:
>
>That would be new authorization... the Motorola units I described
>already have authorization.

And will continue to have authorization unless the rules change, as
they did for amps between 24 and 35 MHz.

>> (b) After April 27, 1978, no person shall manufacture, sell or
>> lease, offer for sale or lease (including advertising for sale or

>
>For new manufactured equipment, the motorola amplifiers are still valid,
>made before the ban.

You don't have a single brain in your head, do you Skippy? The amps
you mention work ABOVE 35 MHz! And even if they DID work between 24
and 35 MHz then they have lost their authorization because of 2.815!

>> Which means that any amplifier that can operate between 24 and 35 MHz
>> has lost it's certification/type-acceptance.
>
>As you try to interpret the rules to preexisting legal equipment. Not
>the case in my interpretation of the rules.

Your 'interpretation' leaves much to be desired, especially when you
ignore part of the rules (as you did when you cut my post).

Wasn't your question to the FCC about if you could modify your 35 to
54 MHz amps to operate below 35 MHz? What did you finally get for an
answer on that "official query", Skippy?

>> In case you are too lazy to read them yourself, they clearly state
>> that you can't change the frequency range (and still use them under
>
>Don't have too... they function exactly as designed without
>modifications.

Duh! But you were talking about modifying them, or do I need to dig up
that post, too? You actually enjoy talking in circles to avoid the
truth, don't you, Skippy?

The file number is invalid. Instead of getting smug about it, why
don't you check to see if you typed it correctly. Maybe there is a
zero that should be an 'O', or you left off a number or something.

>> >:> Hard copies are the bottom line frankie...
>> Not if they can't be verified.

>> are just full of lies, aren't you Skippy?
>
>Yep, as authorized by the FCC for the current hard copies I have in my
>hand. Call us both liars Frankie... enjoy your crow dinner.

Well, if you could provide a valid file number or call sign it might show that the license was obtained before the consolidation, which would therefore be for the IB service and is perfectly fine as far as I'm concerned. But your desperate attempt to avoid providing proof leads me to believe that you have something more to hide than just the validity of the license. Hmmm... is there something about that license that you don't want anybody to see, Skippy? Are you using false identities to obtain multiple licenses? Or maybe you got the license under false pretenses? Do you lie on your applications, Skippy? Because I can't see any other reason for avoiding such a simple disclosure when all your information is already in your other licenses. Maybe you just don't have that license at all, or it has already expired. Which is it, Skippy?

The thread is not useless at all -- it has done well at demonstrating
your technical incompentence.

>Sweep tube is still a label... of which can be further detailed.. if
>anyone but Frankie G wants to go there.

Let me guess... the topic has "a number of parameters better reviewed
in a separate thread", too many "complex sub-topics", deals with
"conventional design guidelines", and is "way to complicated to detail
here", right Skippy?

>> no difference, and used your favorite buzzword "classic" to describe

>never used in TV sweep or similar circuits.
>
>We don't have a problem calling an equivalent tube by the same label,
>it fits and it works, the results are the same in the applied circuit.
>You are left out in the cold...

I would expect a degree of improvement by the 8950 in an RF
application, but since they were not designed for TV sweep
amplification I wouldn't expect them to perform there very well. But
like I said, call them what you want -- I would rather use the label
of "RF tube designed from a sweep tube". If you have a problem with
that then it's YOUR problem, not mine.

You keep ignoring that the topic is the application of sweep tubes in
RF amplifiers, both grounded-grid and common-cathode. It's not my
fault you don't understand the difference, so quit trying to narrow
the issue.

> The specific issue is the multiple connection schemes
>possible which would damage tetrode/pentodes in some triode
>connection schemes. You don't appear to have knowledge of the

A high-mu tube doesn't need to draw as much grid current as a low-mu
tube, Skippy. And grid current doesn't change the mu of a tube, as I
said before, but you deny and refuse to explain why (because you
can't).

>> >Applied Grounded Grid Pentodes and Tetrodes Amplifiers have complex sub
>> >topics which can be hashed over in seperate threads. I'm not about to

>Not quite... no where above does it say triode connected sweep tube is
>not operating as a triode.

You are too much, Skippy:

"Triode operation is not a good label... most rf people like
descriptions like low-mu."

"Triode operation is a bit liberal..."

And when asked directly and specifically...

>: 4. How is the triode configuration of a tetrode/pentode not like a
>: triode?

...you avoided the question completely by ragging on the same old
mistake...

>The "triode mode" grid to plate connection you described is not used in
>many/most rf amplifiers, regardless of the tube type. You clearly showed
>your background example was from the tube audio world and does not play
>well in rf applications. Your theory is weak in rf... the topic of
>choice.

And you have been sidestepping the issue ever since, tossing out bogus
concepts like "passive gain operation", and misusing real concepts
like "reverse screen current".

Like I said, you have no idea what you are talking about.

You are a moron, Skippy. I was replying to my own post because you
didn't, and I said that before. You would also see that fact in the
headers and in the first lines of the post, which you conveniently
snipped.

And you also snipped the question, "tell us what a "classic" design
entails", to which you responded:

> So again, check your
>reverse screen current frankie...

An answer that means nothing at all becase there is no reverse screen
current in a pentode or beam tetrode (sweep tubes) whether they are
common-cathode, grounded-grid, or even triode-connected!

You can try to use your own vagueness as an excuse, but it just don't
wash, Skippy. You didn't bring up reverse screen current just to be
obtuse, and you continued to describe (incorrectly) how the screen
prevents the need for neutralization.

>If you properly read the text,

...oh brother...first it's "properly designed" and now it's "properly
read"... can you be any more vague...?

> I was staying true to the actual
>subject of the moment... tetrodes and pentodes in g-grid circuits.
>One of the major reasons grounded grid circuits using tetrodes and
>pentodes don't often require neutralization. The statement still
>stands...

It fell a long time ago. Let me quote you a bit from one of my
favorite text books (that you despise because they contain facts that
contradict your RF voodoo):

"The top end of the tank circuit is feeding RF energy back to the grid
via the grid-plate capacitance of the tube and is attempting to make
the stage oscillate. When a _neutralizing_capacitor_ Cn, having the
same capacitance as the interelectrode capacitance of the tube, is
connected between the bottom of the tank circuit and the grid of the
tube, the grid is fed two equal and opposite voltages at the same
time, one through the tube and one through the neutralizing capacitor.

The net result is zero effective feedback to the grid from the plate circuit, and the stage will not oscillate. It is neutralized."

And a few pages later it describes grounded-grid amplifiers:

"...The top of the input and the output tanks are positive at the same time and are in phase, not 180 degrees out of phase, as with grounded-cathode amplifers. With this phase relation no regenerative feedback occurs and no neutralization is required, an advantage in HF, VHF, and UHF circuits."

I should add that the example circuit in the book is a triode, NOT a tetrode, pentode, beam tube, or any other tube with a screen. Those are described later in the book. The screen is NOT responsible for the lack of the need for neutralization with grounded-grid amplifiers. Any other book on the subject will say the same thing.

Now how long do you want to keep this up, Skippy?

>> First, as I have said many times but you fail to seek the truth for
>> yourself, neutralization is not required in a grounded-grid amp
>> because it's a non-inverting amp.
>
>The Non Inverting circuit is not the key, nor is it the dominant
>factor of a grounded grid amplifier.

See above, as well as any basic electronics textbook.

>> Second, grid shielding means absolutely nothing in a grounded-grid
>> amplifier -- if it did, then your input signal would never get past
>> the grid to the plate!
>
>Not true, you are wrong.

Well if the screen is providing enough shielding to prevent a feedback from getting from the plate to the cathode, then it's certainly preventing the signal from getting from the cathode to the plate! Or is this a magical kind of grid that is selective as to the direction of electrostatic coupling? Maybe it's a "bird screen"... hehe...

>> Third, Cgp never changes because it's a characteristic of the tube,
>> not the circuit. The capacitance AT the grid can change by changing
>> the circuit, but that's the INPUT capacitance, NOT Cgp! I have said
>> that many times as well, and just like every other fact, you have
>> failed to verify it for yourself.
>
>You keep jumping back to the tube Cgp when the topic was the actual
>problem C of the common cathode circuit C, much reduced grounded grid

Beam forming plates are usually grounded, and have the same effect as
the supressor of a pentode -- they prevent the space charge from
hitting the screen. Now what's your point?

>> > A more serious directly

Once again, what about the electrode spacing? How is it different than
a 'non-beam' pentode? How does it affect the operation of your
triode-connected sweep tube?

What's your point? Where are you going with all this, Skippy?

>But you didn't...

Because "swamping" the cathode (not a very good term, BTW --
low-impedance signal source is much better) only relieves PART of the
problem. The other problem, as I have stated many times, is the
linearity through grid current transistion, which is what the post
addressed, NOT cathode "swamping".

...good grief. Get yourself a decent news browser so you can go back
and read the previous threads. Out of all the browsers I tried, even
MSIE, I liked Agent the best. You should try it sometime. Then maybe
you can read the previous posts and see that the conversation has
never been limited to grounded-grid amps, despite your desperate
attempts to do so.

>Just as a side bar comment, not all common cathode amps require
>neutralization. Its not rocket science to build a stable common
>cathode amplifier less the neutralization requirement.

Duh! I said that a long time ago! It's VERY easy to build one without
neutralization when your Cgp is so low that stray capacitance in the
grid circuit is enough to neutralize the tube. Where have you been,

Skippy?

>Unless you put on the the turn signal... we are talking grounded

I have been doing it all along, Skippy. You have been out to lunch on
the issue.

> By the way, did I tell you I have a two tube common
>cathode sweep tube amplifiers at 28.55 MHz that has better than
>10dB gain and no neutralization...?

10 dB gain from a two-tube common-cathode amp? That's PATHETIC,
Skippy! You should be getting AT LEAST 14 dB from those tubes, which
means that you have neutralization in that amp but don't know it, and
it's causing your poor gain figures. Hey, why isn't this amp posted on
your sonic server, too? LOL!

> How about you throwing out
>a circuit now..? How about you answering up with any text you've
>posted any where on the net that we can review... of course other

>processed SSB signal using ALC.

I wouldn't run a sweep tube that DOESN'T have an ALC circuit, and I would NEVER run a sweep tube grounded-grid. The proof is in the pudding -- they simply put out too much grid-current distortion, and all the noise figures for all the grounded-grid sweep tube amps back up that fact. "Plain fact, jack..."

>In regular operation, you couldn't tell I had it on the air, other
>than the increased signal strength. That's what amplifier operation
>should be all about.

It should be, but frequently that's not all that comes out of the coax.

You brought it into the conversation, Skippy. You used it in context
with your explanation of how a triode-connected sweep tube doesn't
work like a triode, but are now recanting because you think I'm stupid
enough to buy your excuse that it had nothing to do with the question.
"nope, won't work here", Skippy.

>Let us filter through the confetti and get right back on the topic.
>
>The doesn't work like a triode refers to the benefit of the additional
>shielding from the grounded screen and supressor grids.

Nice try, but you can't shield the plate from the cathode without
shielding the cathode from the plate, cause the amp wouldn't work! And
your precept for shielding stems from your unwillingness to understand
the basic operation of a grounded-grid amp, the regenerative feedback
effect of interelectrode capacitances, and the neutralization of the
same.

And that STILL doesn't explain what you were allegedly referring to
when you brought up 'reverse screen current' (if not about how a
triode-connected sweep tube doesn't operate like a triode).

> To make the
>round trip, I also claim that the type of AB2 grounded grid circuit

>using triode connected grounded grid sweep tubes because there is a
>problem (previously explained) trying to run them in some applied
>triode g-grid circuits. It's all about the tube geometry...

Well then explain why this tube geometry affects the operation of a
triode-connected sweep tube. Come to think of it, you have used the
phrase "tube geometry" several times, but just like all your other
meaningless catch-phrases you haven't gone into any further detail or
explanation. Do you think these things explain themselves, Skippy? Or
do you think that I don't know a bluff when I see it?

>diatribe of the moment

WTH are you talking about? I said that a cathode resistor on a
common-cathode RF amp is a bad idea because it ungrounds the cathode.
What does that have to do with your claim that a series resistor on
the cathode of a grounded-grid amp improving linearity?

> when I only state the resistor improves
>linearity, the cause... by providing degeneration.

Attenuation is not the same as degeneration (degenerative feedback).
Go read your Electronics 101 book, Skippy.

> You did not
>properly address the issue because you don't understand AB2 grounded
>grid circuits very well.

I understand the issue very well and have previously addressed it.
I'll even give you the post ID (which I have done several times
already and twice today):

<3dcb7d8f.6835690@news.cet.com>

And you are STILL avoiding the issue at hand; namely, your confusion
between AC and DC grounding of a grid.

Your best bet would be to, as someone already said, get a mirror mount
antenna or dual mirror mount antennas.

Or if you don't want mirror mounts then try gutter mounts. You need to
get the bulk of the antenna above the roof, or at least some distance
away from the vertical surface of the van.

Check these antennas and mounts out.

Not entirely. Another magnet on the inside of the roof will work.
The bigger problem is that those antennas need the ground plane of the roof
to work right.
He might be better with a marine CB antenna, they are designed to work
without the ground plane.

Without being there and seeing it in person, it's difficult to say exactly what's the best solution for you. Mounting the base loaded antenna low like that was definitely not the best idea.

A marine antenna might be an interesting option, you can mount those on the roof, and they don't require any metal ground plane.

>excessive drive. There is always a measurable amount of poop going
>out the door before the circuit reacts. In a compressed speech
>chat, poop is in generate mode because the ALC cannot keep up.
>i.e. time constants.

Most of your "poop" is generated because your speech processing
includes clipping of the audio signal! As long as you don't drive the
ALC too hard you won't have any "poop" to worry about, regardless of
the time constants. And that's a pretty good argument against trying
to squeeze every last watt out of a rig.

>In another topic we could talk about how to deal with the loop

No kidding -- it improves linearity by pulling the amplifiers out of
saturation and back into the linear portion of the EgIp curve.

>> The acronym 'ALC' stands for Automatic Level Control which, for all
>> intents and purposes, is a compressor. The ALC is a circuit that
>> reduces the input or gain when the amplifier becomes overloaded. By

>If the input power reduction happens late, poop happens early. With
>each new word in some cases... I'll hear you up the band with your
>"contest audio." Who's the bad boy now..?

The ALC circuit, just like any other compressor, is set to react
whenever the input reaches a specific level. That level may or may not
be in the linear region, but the lower the better. It also has an
attack time that must be set -- again, the lower the better. Provided
the amp is used according to the manufacturers recommendations and not
driven beyond the ability of the ALC circuit to control the amp, there
won't be ANY "poop" to deal with.

>The power control knob of a modern amateur radio should not accused
>of causing distortion.

>> whole lot better than each every RF peak being clipped from a limiter.
>
>Most modern amateur speech processors are not limiters.

The hell they aren't! Most of them work by simple diode clipping and
subsequent filtering. Some work via fast AGC circuits which have the
same effect, but with less filtering required because of the soft
clipping of an AGC amp. There are a few speech processors that use
log/anti-log amps or RF processing, but those are quite rare.

> A couple
>of peaks are going to sneak through each time the ALC loop fails

If you had a decent news browser you would see that it was ME that
brought it up while talking about the Swans. But a nice try, Skippy.

>> >Before the ALC acts (time constant)... unwanted poop is piped out the
>> >coax connector to the antenna.
>>
>> See above.
>
>I can... You "suppose" poop happens, I know "poop happens". Hey..!
>Frankie helped me make a funny... :-)

I said that I suppose there is a very small and insignificant amount
of time where a signal will slip past an ALC circuit when it's working
correctly and not overdriven, or couldn't you gather that much from
the context? I also said that speech compression causes distortion of
the audio input to the amp, which it does. Have you thought about
getting one of those glare-screens for your computer monitor?

>> >Depending on the ALC to throttle your tubes back results in much higher
>> >levels of initial pre alc action poop. You can hear that poop as buckshot

>
>Depending on ALC action most often results in over driven amplifiers,
>dat's da fact jack...

No doubt that ALC circuits are frequently overdriven. Some people just
gotta have those extra few watts!

>RF Limiters are another animal which cover a lot of ground. Without
>you going off to never never land again... how about you first read
>and understand how the power control knob on a modern amateur radio
>actually works...

By adjusting the bias, attenuating the input, and/or varying the
screen current of the common-cathode final. What's your point? And
what does that have to do with RF limiters?

>Controlling or limiting the output power of a modern amateur radio is
>not the distortion generation device your trying to describe....
>really frankie, read up on it before you comment please.

You are confusing 'limiting' and 'compression', Skippy. A limiter
prevents a signal from exceeding a specific level, usually by
clipping. It distorts the signal. A compressor (of which the ALC
circuit is an example) decreases the gain and/or input according to
the output level. The signal remains relatively unscathed.

>> >: you claimed had "linearity detectors". You also claimed that ALC

>> >
>> >At one time, ALC was thought to work pretty well for the most part.
>>
>> It still does.
>
>For those who know no better and are happy with dated technology.

That includes anyone that uses incandescent light bulbs, convection
ovens, and that wonderful invention by Thomas Crapper. All "dated"
technologies by your standards.

>Modern radios do a better job with ALC, but it's never fast enough.
>This is where the power control knob on the radio works better.

Are you trying to tell me that you can turn a power control knob
faster than an ALC circuit can react to power peaks? I hope not!

>> >Relying on it for rf compression is poorly applied technology. If you

>
>But you do...

I expect it to perform the fuction for which it was designed. I have
also stated many times that you shouldn't overdrive your amp -- and
consequently overdrive the ALC circuit -- because the ALC has it's
limitations. Matter of fact, I made a point of that when talking about
the Swan 500, or are you missing that post too? Funny how you have
been able to read all of these numbered posts but STILL can't find
those other posts -- you aren't ignoring them, are you Skippy?

I don't make such assumptions. I have been in the business for a long
time, and in the position many times where I was told to fudge the
figures in order to pass specifications. And even a two-tone test
won't necessarily show the inherent "poop" when an amp hits those
modulation peaks normally encountered with human speech. You know that
as well as I do.

Some of them did indeed have authorization. But that authorization has
been rescinded, or can't you comprehend that fact? I even quoted you
the regs, but you snipped part of them and claimed that it's all up to
your interpretation. Unfortunately, Skippy, it is NOT subject to YOUR
interpretation, but it is clearly spelled out in the regs. What part
of "law" don't you understand?

>The big deal that the Dentron GLA-1000C and I believe the
>Amp Supply LA-1000 models were both post ban amplifiers legally
>sold in the US.

I do believe that they were post-ban amps, but I think if they were
legal in the US it was before the amendment placing restrictions on
amps that are easily modifiable for the prohibited freqs.

>>
>> > The FCC said go and the various mfgrs legally built them.

I have been here talking about sweep tubes AND RF power tubes, and
watching you trying to narrow down the topic to grounded-grid sweep
tube amps only while covertly redirecting topics where you show a
serious lack of technical competence.

>Variety is the spice of life.... even Handbook projects using RF
>power tubes are not specific to one single type of valve.
>
>Life goes on...

Yeah, but the life of sweep tubes is just about over. Why are you
hanging onto this "dated" technology?

>require parasitic suppressors to operate in a good high gain HF
>circuits. Pop in a similar size valve in the same circuit and chances
>are it's going to sing like a big dog.

That's a load of "poop" and you know it. Any circuit to which the 8877
is connected is going to have resonant frequencies -- that's just a
fact of RF amps you can't avoid. As long as the tube can amplify on
those frequencies, there MUST be some method of dampening the
unintended resonant frequency of the circuit. It's not the tube, it's
the circuit, Skippy!

>The type of tube matters... don't know how to say it any clearer to
>you.

You said it clearly enough, but you are still wrong. The tube is only
a component of any parasitic resonant circuit in the amplifier. Unless
the tube has some magical "resonance detection-and-dampening" device,
you still need some form of supression of those frequencies. No tube
is immune because the tube is just the amplifier, not the whole

resonant circuit. This is first-year electronics, Skippy.

>Your "predisposition to parasitics" is not really a good term...

The concept is yours, and it's not really a good concept.

>but the tubes such as the 3-1000z and the 3-500z in mfgrs rated
>applications have a well known and documented track record
>of parasitic problems. Readers can reference text at
>http://www.vcnet.com/measures for more detailed information.

You should take a look at that site a bit more closely. A lot of the info is good, but a lot of it is also very bogus, such as the idea (which you adopted) that neutralization isn't required in a grounded-grid amp because of 'grid-screening'.

>For more detailed study of a tube which is not generically subject
>to parasitic problems, please research the 8877, in specific...
>the grid construction. The mfgrs data sheet might be a good
>place to start.

I have already done so, and I even posted some information from the datasheet in this discussion. There is nothing in the datasheet to indicate that it is immune from parasitics. Because, Skippy, parasitics are an effect of the CIRCUIT, NOT just the tube.

>Your simply wrong again Franklin... or frankie...

All the data and facts support my comments and contradict your's. It is YOU that is wrong again, Skippy.

Childish name calling will not cover up your problems.
How would I know what "Free Agent" has... look at my header,
do I use "Free Agent", have I EVER.
Do you know every function of every piece of software in the
world... exactly.

> My 'filter' is my own brain.

So, that's what is not working right.
Why don't you get a better Newsreader... one with a filter. I know, you
don't really "filter" anyone... and you have no wish to. If you filtered
those you do not like on here, you would have so little left to reply to and
even less that would actually interest you like the posts from those who you
call "Keyclowns".

> And when I read your

So, you admit that, although you "plonked" me, you still read the
messages I post.

> BTW, you have said
> several times that you have ME in YOUR killfile.

Your memory certainly is failing you.
Try looking back through the posts. You will find that you brought that
up before, and I explained... you changed your header info, so appeared
on my system again.
After that, YOU claimed to "plonk" ME. I NEVER said that I had put
your new name in the killfile.

Look it up, Yeti... make a note of it... pin it to your wall. That way,
your senility need not be such an embarrassment to you.

Brainbuster.

Even higher power tubes are easy. All a parasitic supressor does is
damp the frequency of the parasitic. Activate your GDO (or set the
tube up for very low gain) and measure the frequency of the parasitic

(or parasitics). Once you have identified where they are coming from
and their frequencies, it's a simple matter to eliminate them with any
of several methods, and the common resistor/inductor supressor is only
one of those methods.

That's how amplifiers are PROPERLY designed, Skippy. Not by picking a
tube because you heard somewhere that it doesn't require parasitic
supression. That's lazy and lame.

And you STILL haven't shown any understanding of the fundamentals
behind neutralization.

Yeah? Isn't that what I said over a week ago? Duh!

>Why wasted the hardware, it's simply not required in most grounded
>grid amplifier designs. Of course unless you and __________ say it
>is.

What wasted hardware? Common-cathode amps don't have the impedance matching requirements of grounded-grid amps, so there's some wasted hardware for ya, Skippy.

Your description of your "classic" grounded-grid amplifier changes so
often it's hard to tell what you consider "classic". Regardless...

> It is very bad news to ground
>the G1, G2 and G3 grids together... and you don't even have a clue
>why...

You STILL don't get it, do you? Judas Priest, how many times to I have to tell you -- if all three are RF bypassed to ground, then all three are GROUNDED! Every amp you have touted as being similar to your "classic" grounded-grid amp has all three grids GROUNDED!

>I'll put aside your Cgp statements for the moment until you review
>and understand why one should not ground together the G1, G2 (and G3)
>grids with many types of tubes, based on their geometry. That includes
>rf power tubes like the 4cx250b.

The 4CX250 isn't designed for grounded-grid operation. And don't put aside your ridiculous ideas that Cgp changes because it's in a grounded-grid circuit, because not only have I already demonstrated that it doesn't, and tomorrow I fully intend to give you an actual measurement of the effective Cgp of a triode-connected 6LF6. You can verify the measurements for yourself.

>Your plane just crashed frankie...

Get ready with your excuses because it's YOUR plane that's going down tomorrow, Skippy.

>
>The subject is well covered at http://www.vcnet.com/measures
>
>Don't take my or Frankie's word for it... grab some Radio Handbooks
>and review the web page text mentioned above.

Do it yourself, Skippy. But don't bother with your referenced website -- use a definitive source for your facts. Matter of fact, even the ARRL handbooks have been known to have a few errors in them. Try your local library. Even better, if you have a college or university nearby (and I know you do), stop by their library and spend a couple hours verifying your facts. I think once you get started, hours will turn

into days as you realize that half the stuff you have learned from the internet is bogus.

>You'll grow old waiting for Frank to post any articles of text
>he's authored. Even though I said please numerous times.

Ain't my bag.

Never been bald and never had a blood pressure problem. But your
sarcasm is growing more and more intense as I chisel away your
internet education and get to the truth of these issues.

>So how about answering my questions... how many grounded grid
>amplifiers have you seen in operation...? make and model..?
>any..?

More than I care to count, but I can honestly say less than a hundred.
Worked on lots of industrial amps, and a few amateur amps (sweep tube
amps included, including the Dentron you referenced). As far as make
and models, there were a few I remember. Like the P&H, used four 837's
which were a bitch to find at the time. There was a Gonset, I think it
was a GBS-101 or something like that -- terrible in the harmonics
department, using no tuned circuit on the input. A couple Heathkits, a
couple Johnsons, a couple Collins, etc. Some were better than others.

And BTW, no broadcast transmitter I have ever seen used a
grounded-grid anything, except for a couple low-power antiques that
take up the better part of a room. Matter of fact, I own one of those
antiques, an AN/FRT-39B.

>that magical grounded grid AB1 amplifier make and model handy...?

YOU made the statement that AB1 operation of grounded-grid amplifers
does not consume input power, and now you want to back out of that by
crying about some "magical" grounded-grid AB1 amp? Lame, Skippy, lame.

But it's not "magical" at all. As I have pointed out earlier, your
grid is normally biased 5 to 10 volts negative to the cathode, giving
you at least some area under which no grid current flows, yet still
consumes power from the input source. And just to point out what used
to be a common practice, grounded-grid amplifiers running Class A have
been used as front-end amplifiers in receivers, and they were used
with the intention of providing a low-impedance input to the receiver.
Works very well! Now if no input drive power is consumed in a Class A
amplifier, then the input impedance would be theoretically infinite --
just as if it were common-cathode. But it's not infinite; it's a low
impedance usually around the impedance of most transmission lines.

Now go find your Electronics 101 book and start reading it already.

>> of grounded-grid amplifier consumes input power (meaning power from
>> the signal source). The input is on the cathode, and it is impossible
>> for the tube to conduct (and therefore amplify) if there is no cathode

>AB1, no grid current flow.

But cathode current still flows, both DC and AC, and since there is an AC current flow in series with the signal source then the signal source is loaded by the tube. Check it out, Skippy. You know I'm right, you just refuse to check the facts for yourself. Actually, I think you are just arguing for the sake of arguing, since you aren't even providing any facts, just lame opinions.

>Back latter for number 18 ... gotta' go check my reverse screen

Well Said!. Sounds like the DK is too low to excite the meter. Why some think that a 2 or less DK sounds good on AM I can't figure. Supertune - OH boy.

I would borrow someone else's radio that hasn't been into and try checking the antenna. If this has already been suggested sorry for the repeat.

Long thread. I would question why a shop would sell you a K-40 when you are intending on using a 400. Unless that wasn't made clear.

The K-40 comes as a roof mount antenna. You could install it that way. Based on the extensive experience with hunters and K-40's, don't hit anything with it. (hard). A K-40 although a wonderful antenna is not a durable antenna.

I believe you said this is on a van? Conversion van? If you are going to use that kind of power, get another antenna and put this antenna on your car. Good luck because the customer is always right. Your shop should have explained all your options and sold you the best antenna for the job. Vans are challenging for antennas. I personally don't recommend the dual on anything. A properly fitted and tuned single antenna will do the job you need.

Just my 2 cents worth.

When you say "certified" and "approval" are you referring to "type acceptance"? If you are, since when did amateur gear need type acceptance? If you are not referring to such, then what ARE you referring to?

>The term "type acceptance" is not used any >more. If you will notice, >when you see a new Yaesu,
>Icom, or Kenwood Amateur transceiver about >to be introduced, you will >see a small disclaimer down at the bottom of >the ad that says, "has not received FCC >approval for sale to the public"--or
>something to that affect.

And has little or nothing to do with the selling of hammie rigs currently on the market.

>Regardless of what service a radio is
>targeted towards, it must meet certain >requirements set by FCC for >commercial manufacturers in order to be >approved for sale in that >particular service. While there is no "type >certificate" for Amateur >Radios, commercially
>produced radios for that market must meet >certain baseline >requirements before the Fed will allow
>it to be imported/sold in the US. That is the >"rub" with those alleged >10 Meter "ham" radios sold in
>truck stops; they do not meet FCC's criteria, >they are too easy to >modify, they have "band" switches which allow >the radio to cover >SEVERAL "bands" of frequencies. Ten Meters >is O N E band, so a 10 Meter radio doesn't >NEED switches to cover one band. Ten
>Meter ham radios,
>the REAL ones, don't have incremental >"channel" positions or echo, or >even those banal squeaks

>quirements for spectral purity according to >Part XXX, Title 47, US >Code....."

So. Manufacturers were never mentioned in the original post. The 100 watt radios could have been Icoms for all you know.

>Icoms sold in the domestic market have the >required approval for sale; >Galaxy's do not.

That's right..but once again, no one mentioned brands until I mentioned that the 100 watt radios could have been Icoms.

YOU entered the "illegal" concept into the equation.

>Those
>Galaxy, Connex, Magnum so-called "10 >Meter" trash has NO such
authority, no such >sticker, and
>appear on a list of equipment (which I will >once again post here in
the faint hope that you >might grasp the reasons why said equipment
>cannot be legally sold in the US) that has >been determined by FCC's
test labs NOT to >meet one or more of their test criteria.

Hmmmmm. What gave you the impression my interpretation was any different
that yours?
I understand the reasons quite clearly. Never claimed otherwise.

>Without that approval, FCC can most certainly >raid, seize, and fine
>outlets that sell such equipment. Like you, >tools, some of those
>outlets themselves believe they have a "right" >to import and sell such
>junk, but they don't. It is only a matter of time >before the sh** hits
the fan. ....and I can't >wait! Hehe!

Each day the skip fades is less dx interference to those that have a
problem with it and the chance of anything hitting the fan decreases
with the sunspot activity level.

--

Hey, the cb shop can be owned by a licensed ham and cater to cb. Dave
Hall N3CVJ did it with his hack shop. Mods and all. The cb shop could
legally sell Icons, Yaesu, etc. See, many hammies do cb work,,,more cash
than in hammie stuff, especially if you get a good name among
drivers...tin' fo' good buddy?

>He still may NOT legally sell those radios that >appear on the list.

Just who is it you are trying to convince of this? I haven't seen anyone
take issue with this.

>Legally, he can
>sell the regular ham radios to anyone.

Which is all I was saying.

>Me, I wouldn't sell one without proof of license. >Legal is legal,
>illegal is illegal, no matter WHAT "license" >one has.
>J

Agreed. At least you aren't here calling people names and wailing about
those whose behaviors you possess yourself.

Well Tom, he has a van with a fiberglass roof what a mag mount is out of the question,

"Not entirely. Another magnet on the inside of the roof will work."

>So will a small metal plate.

I know someone that sells those things down here and calls 'em a richochet skip dish, although the application is more practical than anything. It's diamond plated (like some truck beds) and comes pre-drilled with mounting instructions. It's primary use is for mounting a penetrator-like antenna directly behind the cab of a pickup but approximately 6 inches to a foot above a truck-mounted toolbox. There are even set-ups for p/u's with a cap. This guy is prettty well known in dx land coming out of the swamp here in the land of sand.

>I had a 4 foot one for the longest time before just strapping up an
>antron when asea. Huge difference..the small ones suck for cb, but his
>options do seem a bit limited.

I have a similar problem with my rig, even though I'm running VHF and UHF,
the antenna ends up at 11' off the road. Comet and Maldol make powered
mounts that will raise and lower the antenna at will. $100 per mount, but
I'm seriously considering it, since my antenna has no springs or other
"give" mechanism. If I hit anything, something's gonna break, and it might
be my roof!

http://www.inchase.org/outflow/events/installnic2002/f5Mount.html
This is the installation of my big VHF/UHF stick.

Problem . . .

Most Yaesu transceivers can be easily modified (often with a simple change effected through the menuing system, as is the case with the FT-920) to transmit on CB frequencies (and, in most cases, on other unauthorized bands as well). This is, of course, true of most (if not all) brands of Transceivers.

By the definition cited above _all_ such transceivers would be treated as illegal for marketing in the United States. Is there a rationale (in the law itself) for including only transceivers limited to 10m operations (which, of course, many _legitimate_ amateur transceivers are designed for) or is this an arbitrary application of a regulation that, technically, should include all transceivers capable of such modification?

I'm _not_ supporting the use of 10m rigs for CB use, obviously. But I do question the legitimacy of limiting the sales of radios that _are_ designed for amateur use (and are often far less expensive than comparable "approved" 10m rigs) on a basis that by any logic can and should be applied to _all_ transceivers capable of similar modifications.

Can anyone clarify this one?

FMRNYCER,
Well, how about a 'trunk lip' mount on the front
of your van (engine compartent), or a mount on a
rear door? The idea is to get as much of the antenna
as far away, and above the van as possible. Something
like a K-40, or another 'short' antenna, rather than
the 102" whip. Not that there's anything wrong with
the whip, it's just that there are other possibilities
that will work as well and may not be as 'objectionable'.

Perc',
Using a 102" whip on the bumper is about as
inefficient as a base loaded shorter antenna.
Rather than loosing anything in a coil, it looses
it by being as near the van body as it will be.
If both antennas were mounted in the 'clear', I'd
probably agree with you, but with how the ship
would be mounted on the bumper, there's just not
a lot of difference in efficiency...

Notice the part "... may revoke...." which does not auto rescined
type accepted equipment already in use. You just interpret the
rules wrong Frankie.

> And will continue to have authorization unless the rules change, as
> they did for amps between 24 and 35 MHz.

I don't interpret the rule change to indicate legal licensed services
using type accepted equipment must now be required to replace that
equipment.

Actually no, and after closer examination... the 35 MHz TPL amplifier
previously mention appears similar if not exact to a pre ban unit. It
appears that it might just opperate at 31 MHz without any modifications.

The FCC has yet to give me any reply about the issue... so life goes
on as normal.

> >> In case you are too lazy to read them yourself, they clearly state

I am not even sure that multi-band transceivers COULD be completely stopped from being modi-
fied lest it hinder the multi-band operation itself. I don't know. It is clear, however, to me that the
single-band, 10 Meter rigs on the list are there for one reason; that being to try (not successfully) to
limit dual-use transceivers and to stop their being used by illegals on the ham bands. One thing that
may be a legal plus if the "list" were challenged is that most of these radios have "band" switches.
If a radio is a so-called "10 Meter" radio, then it implies ONE band. If so, it has no need for "band" switches and, therefore, does not meet criteria for a single-band, 10 Meter radio. And we
all know what those radios are REALLY for (wink, wink), right?

If I were inspected by the FCC, there is a copy of the actual IB license at the transmitter and in my office files. An FCC inspector is not going to ask me for proof of the IB service.

> >Don't think so Frankie... so what happens if I scan in an image of the

You didn't answer my question... if I posted the actual image less the personal and non issue information, would you ask for steak sauce with your crow meal..?

> Well, if you could provide a valid file number or call sign it might
> show that the license was obtained before the consolidation, which
> would therefore be for the IB service and is perfectly fine as far as

I'll leave the file number on the license scan frankie...

Ahhhh.... so now your giving notice that IB might actually be real
after all.... Funny how that suddenly pop'd up.

> I'm concerned. But your desperate attempt to avoid providing proof
> leads me to believe that you have something more to hide than just the
> validity of the license. Hmmm... is there something about that license
> that you don't want anybody to see, Skippy? Are you using false

Yes, I'd prefer the details of the local two way market be kept
low profile. All about business.. Like the fact that numerous
people have asked me to throw out your personal information in
these thread posts.
I tell them no, it does nothing for the topic and no one wants
their personal information needlessly thrown out for public
display. Makes good sense...

> identities to obtain multiple licenses? Or maybe you got the license
> under false pretenses? Do you lie on your applications, Skippy?

The license is not mine frankie... a customer who probably not
want his information spread out on a news group just to provide
you with a meal of crow.

Your amps are not listed in the database of currently authorized
equipment, or did you miss that post too? The equipment authorization
of those amps has been revoked. All the facts support this conclusion,
and DON'T support your personal interpretation of the law.

>> And will continue to have authorization unless the rules change, as

You should read those regs, Skippy. There is an amortization period
for equipment in use at the time of revocation. If you write to the
FCC with the FCC ID number of your equipment you can get a copy of the
actual order that rescinds the authorization.

>> You don't have a single brain in your head, do you Skippy? The amps

> fault you don't understand the difference, so quit trying to narrow
> the issue.

I clearly understand the differences... grounded grid and common
cathode are two different circuit layouts. The large majority
of sweep tubes in AB2 RF amplifier circuits have been grounded
grid. How about you give us an example of a common cathode
sweep tube amplifier and we'll hash it out. Otherwise, I'll
stick to the other probably 90 plus percent of the sweep tube
amps made through the years.

> > The specific issue is the multiple connection schemes

It's simple, you stated in more than one post that one can tie
the grid to the plate of an amplifier... we were talking
sweep tube rf amplifiers. I say that your information was
horible and would probably cause the tube to fail.

>
> >>: 2. You didn't know what the term "low-mu" described; namely, the

> eh? Same old Skippy.

You love to see your own writing Frankie... and I understand the
details
applied to sweep tube rf amplifiers (the topic, remember..?) I care
little about your transfer of book definitions to the thread. Especially
when you make horible mistakes as described above.

> >Your again out of steam... try reading up on the issues of high mu
> >tetrodes/pentode in grounded grid rf amplifiers...
>
> A high-mu tube doesn't need to draw as much grid current as a low-mu
> tube, Skippy. And grid current doesn't change the mu of a tube, as I
> said before, but you deny and refuse to explain why (because you
> can't).

I don't care about your comparisons of grid current values. The
sweep tubes I talk about are better applied to AB2 rf amplifeirs
using the circuits connection I like to reference. If we use your
yesterday post example of grounding grids 1,2 & 3... big problems
happen with hi mu tubes... Even rf power tubes like the 4cx250b
will have problems. It's all explained in many of the handbooks,
I don't need to repost it here. It's clear that you don't
understand the grid current issues of Hi Mu tubes in grounded
grid AB2 amplifiers.

> >Not quite... no where above does it say triode connected sweep tube is
> >not operating as a triode.
>
> You are too much, Skippy:
>
> "Triode operation is not a good label... most rf people like
> descriptions like low-mu."

There are at least two possible grid connections for tetrode/pentode
in grounded grid circuits. One is a low mu type of circuit, the
other can be called a high mu grounded grid circuit. They are not
the same. Problems happen when you use high mu tubes in low mu
types of grounded grid circuits. You appear to not know the
difference.

> "Triode operation is a bit liberal..."

Yes, it is often over shaddows the details of the various
grounded grid circuits.

> And when asked directly and specifically...
>
> >: 4. How is the triode configuration of a tetrode/pentode not like a
> >: triode?
>
When the grid connections are set up for low mu operation using

hi mu tubes. That would be the direct grounding of the G1, G2
& G3 grids. You mentioned that layout yesterday in one of your
ramblings... it is not the best grounded grid connection scheme
for Hi mu tubes in AB2 circuits.

I should have been more specific: You can't use if for proof in this
discussion if you can't produce it for MY inspection, or provide some
other information that will allow me to verify it's existance beyond
your claim that it's in your "hot little hands". You say "hard copy
matters", but all you provide are unsupported claims. You said you
have it, now prove it.

You don't have any personal information on me, Skippy. At least none
that came from those "files" you allegedly found on the FCC site.
Matter of fact, why don't you go ahead and post that info, Skippy?
Here's formal permission for ya:

This is a public notice that Skipp May has permission to post any and
all information about me, Frank Gilliland, that he has obtained from
the FCC.

Now back up your claim that you found my FCC "files".

Still trying to avoid the issue. Oh well.

BTW, what I said was that you can tie the SCREEN to the plate, not the
GRID to the plate. And tying the screen to the plate works fine for
audio, it just doesn't work very well for RF, and it certainly isn't
"horrible". If you are going to harp on my admitted mistakes then at
least get the mistake right!

>>

Are you forgetting that all your examples have all three grids
grounded?

> Even rf power tubes like the 4cx250b
>will have problems.

Probably because the 4CX250 was not intended to be wired as a triode
even in grounded-grid operation, or hadn't you thought of that?

> It's all explained in many of the handbooks,
>I don't need to repost it here. It's clear that you don't

We were not talking about the differences between low-mu and high-mu.
The issue is your claim that a triode-connected sweep tube is not
acting like a triode, and then say that you never said such a thing.
And I'm proving you wrong yet again, Skippy.

>> "Triode operation is a bit liberal..."
>
>Yes, it is often over shaddows the details of the various
>grounded grid circuits.

TRIODE, Skippy. Concentrate on the word TRIODE!

>> And when asked directly and specifically...
>>

>& G3 grids.

That's one way to wire it as a triode. It doesn't explain why it isn't
operating as a triode as you claimed.

> You mentioned that layout yesterday in one of your
>ramblings... it is not the best grounded grid connection scheme
>for Hi mu tubes in AB2 circuits.

Perhaps you should provide an example of a high-mu "connection" of a
sweep tube (or any other pentode/tetrode/beam tube) in a grounded-grid
amplifier. Or just draw up a quick and dirty schematic. Or just name
the pins and tell where they go.

And it's funny that your current answer isn't even close to your
answer the first time, where...

>> ...you avoided the question completely by ragging on the same old
>> mistake...

Somewhere in all the above, your trying to connect my reverse screen
current jab with the clearly separated reposted text..? Come on
Frankie... your running out of steam again. You can do better
than that.

>
> > text. Stop making stuff up as you go along Franklin..
>
> You can try to use your own vagueness as an excuse, but it just don't
> wash, Skippy. You didn't bring up reverse screen current just to be
> obtuse, and you continued to describe (incorrectly) how the screen
> prevents the need for neutralization.

Actually, I like to consider the reverse screen current jab a tease
to get your blood pressure back down (or up in the real world).

The truth is, I describe how the screen contributes to the
big picture of why the g-grid amplifier does not require
neutralization. It is not the only reason, just as your cure
non inverting diatribe is not the big picture fix all.

> >If you properly read the text,
>
> ...oh brother...first it's "properly designed" and now it's "properly
> read"... can you be any more vague...?

Previous posted examples... the Dentron GLA update text and the
Palomar 300 (six tube) amplifiers are a good place to start.

> > I was staying true to the actual
> >subject of the moment... tetrodes and pentodes in g-grid circuits.

> >stands...
>
> It fell a long time ago. Let me quote you a bit from one of my
> favorite text books (that you despise because they contain facts that
> contradict your RF voodoo):

Lot's of bookie, from frankie...

> "The top end of the tank circuit is feeding RF energy back to the grid
> via the grid-plate capacitance of the tube and is attempting to make
> the stage oscillate. When a _neutralizing_capacitor_ Cn, having the
> same capacitance as the interelectrode capacitance of the tube, is
> connected between the bottom of the tank circuit and the grid of the
> tube, the grid is fed two equal and opposite voltages at the same
> time, one through the tube and one through the neutralizing capacitor.
> The net result is zero effective feedback to the grid from the plate
> circuit, and the stage will not oscillate. It is neutralized."

So, big deal... it's not required in a grounded grid AB2 amplifier.
We are not talking common cathode circuits at this time.

> And a few pages later it describes grounded-grid amplifiers:
>
> "...The top of the input and the output tanks are positive at the same
> time and are in phase, not 180 degrees out of phase, as with
> grounded-cathode amplifers. With this phase relation no regenerative
> feedback occurs and no neutralization is required, an advantage in HF,
> VHF, and UHF circuits."

And what is the date of your magical textbook frankie..? The actual
issue here is that the entire "in phase" statement goes out the window
when you have tubes with VHF gain (Ft) in HF service. The fly in
the soup of the in-phase circuit theory does not the address the
source of the VHF resonance. The VHF path is the anode C through the
blocking cap to the Tune C. Your HF neutralization cap doesn't
address the VHF Path.

Now if you want to argue the term regenerative feed back vs parasitic
path... the call is made by where the oscillation happens. Care
is required to ensure only one "resonant path" is in operation.
Not always a 100% "give-me" in every grounded grid circuit. This
becomes an larger issue when the amplifier is designed for

mulit band operation across a decade.

Hence we have well known grounded grid amplifiers using RF power
tubes which have well documented histories of becoming rather
large oscillators. The SB-220 and the TL-922 are such animals.

> I should add that the example circuit in the book is a triode, NOT a
> tetrode, pentode, beam tube, or any other tube with a screen. Those
> are described later in the book. The screen is NOT responsible for the
> lack of the need for neutralization with grounded-grid amplifiers. Any
> other book on the subject will say the same thing.

Somewhere in that book you've got text that reads the screen
does not contribute to the reduction in feedback C...? I seem
to have more than one that does. By the way, what's the date of
that book..?

> Now how long do you want to keep this up, Skippy?

As long as it takes to get you to understand the operation of
a sweep tube grounded grid amplifiers. So far you don't get it.

> >> First, as I have said many times but you fail to seek the truth for

>
> I have proven quite the opposite, Skippy. And who is "us"?

Readers of the news group of course... yeah, you've proven twice
that you like grids tied to plates in rf amplifiers. That you threw
out a grounded grids G1, G2 and G3 circuit without understanding the
grid current issues of that design. That you were clue less about
reverse screen current... that you called the KLV tank circuit coil
a shunt. on and on... you've proven quite a bit.

> >You also appear rude and prove to have a potty mouth.
>
> Speak for yourself, Skippy. You are just a rude, and even though you

> the supressor of a pentode -- they prevent the space charge from
> hitting the screen. Now what's your point?

RCA Tube manual... listed for many sweep tube numbers "Beam Power Tube".

I find few if any good beam power tube circuits with the beam forming
plates grounded in AB2 cicuits. Buzzztt...! you lose. insert another
quarter.

> >> Do you mean the spacing between the electrodes, or the spacing of the

>
> You didn't answer the question: what do you mean by 'electrode
> spacing'? And again, what is the point?

Kind of a self descriptive term. Beam power tubes have modified
electrode spacing, not just the special grid spacing, placement
description you provided. You didn't mention it... so using your logic,
we must assume you didn't know anything about it.

> Once again, what about the electrode spacing? How is it different than
> a 'non-beam' pentode? How does it affect the operation of your
> triode-connected sweep tube?

You would have to ask the designer of the specific tube. I see
the point made in more than one tube book. There is a difference
which modifies the performance of the the tube.

> What's your point? Where are you going with all this, Skippy?

Cute frankie...

I used the label "Beam Power Tube, you danced and sang about
hard copy definitions... ranting about lack of Beam Power tube
information and sputtering your grid spacing description text
like confetti across your following news group post.

But your book doesn't seen to go much farther down the Beam Power Tube Path so we missed your inclusion of the other significant parts of beam Power tube construction which include electrode spacing and beam forming plates. Using your known methods of assumption, we must now conclude you didn't have that knowledge when you wrote the text.

That's a point... or two...

We don't really care about the term being great, if one can understand
why it's a good idea to add the resistors in series with the cathode
leads.

Partial relief is good, your concern about linearity is noted.
Remember the part where I said the feed through power swamps the
grid current distortion in a grounded grid amplifiers. That
makes the circuit a real player...

> means that you have neutralization in that amp but don't know it, and
> it's causing your poor gain figures. Hey, why isn't this amp posted on
> your sonic server, too? LOL!

Notice the exact words "better than 10 dB..." frankie..?

It's actually about +13 dB gain where I operate it, but you probably
would have argued about it. I consider 10 dB the min "cost break point"
for most rf amplifier projects.

The amplifiers has no neutralization and I know it

It's such a small power level amplifier that most people don't
care much to talk about it. I'm not going to post every amplifier
I've collected or built on sonic... that would be way too much time
intensive work. So I do what I can as my free time allows.

How about you sending me anything... I promise not to modify your
text... please..? anything..? free web space..? (picture me holding
out a carrot on a stick)...

> > How about you throwing out

I don't waste my time with an ALC circuit.

Again, review and research my previously made statement. "Feed through
power swamps out grid current distortion in AB2 grounded grid
amplifiers." Now that's no rope yank... frank.

>grounded-grid circuit, because not only have I already demonstrated
>that it doesn't, and tomorrow I fully intend to give you an actual
>measurement of the effective Cgp of a triode-connected 6LF6. You can
>verify the measurements for yourself.

Here we go:

G1 to P [G2 and G3 open] -- 8 pF
G1 + G2 + G3 to P -- 15 pF

The EFFECTIVE Cgp INCREASES, just like I said it does! Also, notice that the actual value of Cgp is 5 pF larger than what is specified in the data sheets. Just to make sure I wasn't reading it incorrectly I balanced it on the bridge with a fixed cap -- it is indeed an accurate measurement. I also tested three other tubes (these are all NOS), with the same results. You and your ridiculous theory have just been proven wrong BIG TIME, Skippy!

As if that wasn't enough, just for kicks I did this:

K to P with all grids open -- 9 pF
K to P with all grids tied together -- 10 pF

Not only is there NO additional shielding with triode-connection, but you slightly INCREASED your cathode to plate capacitance!

Skippy, your plane didn't just crash, it plummeted at warp speed and blew open a crater the size Texas!

It's not a reason at all because it doesn't occur in a pentode OR a
beam tube, even when it's connected as a triode! When are you going to
get that through your thick skull, Skippy?

>> >If you properly read the text,

>address the VHF Path.

AGAIN you are confusing neutralization with parasitic supression!
Maybe it's not confusion, maybe it's a deliberate obfuscation...

>Now if you want to argue the term regenerative feed back vs parasitic
>path... the call is made by where the oscillation happens. Care
>is required to ensure only one "resonant path" is in operation.
>Not always a 100% "give-me" in every grounded grid circuit. This
>becomes an larger issue when the amplifier is designed for
>mulit band operation across a decade.

The two concepts are different and distinct, and if you could read you
would know why. Just in case your text-to-speech converter is on the
fritz, let me clue you in: One is caused by regenerative feedback in
the amp as a whole, and occurs on the frequency to which the amplifier
is tuned. The other is caused by unintentional (and frequently
unexpected) resonant conditions in the sub-circuits of the amp (and
NOT just the tube!). Now do you think you can figure out which is
which?

>Hence we have well known grounded grid amplifiers using RF power
>tubes which have well documented histories of becoming rather
>large oscillators. The SB-220 and the TL-922 are such animals.

Were those oscillations parasitic or on the tuned frequency? Are those
grounded-grid amps? What kind of parasitic supression did they use?

Any? Did they take your advice and build an amp without any parasitic
supression? LOL!

>> I should add that the example circuit in the book is a triode, NOT a
>> tetrode, pentode, beam tube, or any other tube with a screen. Those
>> are described later in the book. The screen is NOT responsible for the
>> lack of the need for neutralization with grounded-grid amplifiers. Any
>> other book on the subject will say the same thing.
>
>Somewhere in that book you've got text that reads the screen
>does not contribute to the reduction in feedback C...?

Feedback capacitance in a grounded-grid amplifier is irrelavent
because the cathode and plate are in phase, or haven't you read that
far in your Electronics 101 book yet? Despite that, the screen
INCREASES the cathode to plate capacitance as I have already proven by
experiment!

> I seem
>to have more than one that does.

The only information you seem to have learned seems have come from the
internet -- I would be astounded to see you quote something from a
legitimate and authoritative publication!

> By the way, what's the date of
>that book..?

Are you actually going to claim that the fundamental operation of a
grounded-grid amplifier is "dated"? That's about the lamest argument
you have come up with so far, Skippy! I suppose that you think the
concepts of Ohm's law and Maxwell's equations are "dated" as well?

>> Now how long do you want to keep this up, Skippy?
>
>As long as it takes to get you to understand the operation of
>a sweep tube grounded grid amplifiers. So far you don't get it.

I get it fine -- it is YOUR understanding that is deficient!

I believe a review of the original post is quite clear to everyone but
you frankie. The reverse screen current jab at you was never used
"in context" with any explanation I made. Maybe next time...

>
> >Let us filter through the confetti and get right back on the topic.

Oh my god, we're back to square one with you. I guess the Eimac
Engineer who first told me about it was wrong in every Radio Handbook
I've seen it written in.

> And that STILL doesn't explain what you were allegedly referring to
> when you brought up 'reverse screen current' (if not about how a
> triode-connected sweep tube doesn't operate like a triode).

'Twas a jab at your temper tantrum of the moment frankie. That's
all... until you appeared so shocked about seeing the post that
you claimed it was a new one for you. Of course until you picked
up a book and found text on reverse screen current.

Now your running out of steam again... plus the words boring
come to mind Frankie. Stop boring us trying to make something
out of nothing.

> explanation. Do you think these things explain themselves, Skippy? Or
> do you think that I don't know a bluff when I see it?

Meaningless as found in Radio Handbooks authored by Eimac Engineers.
If you can grasp the difference, see my description of the three
directly grounded G1, G2 and G3 grids amplifier amplifier and compare
it to the palomar 300 (six tube) circuit. The triode connected sweep
tube will not play well ("plays well with others...") in the directly
grounded AB2 circuit. Dat's what I'm talkin' bout frankie...

And just to add the cherry topping... it's all directly related to
the tube geometry of a particular style of tubes... such as the
4cx250b and various Beam Power Sweep tubes. The AB2 G-Grid layout
which connects the G1 & G2 grids as one is a bad boy for the
4cx250b and many Beam Power "sweep tubes".

> where you explain about "basic AC and DC load lines", Skippy?

Yeah, I seem to remember you blowing gas about them causing
ungrounded cathodes and a list of horror stories.... when in
fact, they are a very good idea. I don't care to waste time
explaining load lines here... but the resistors function by providing
degeneration to the circuit; said degeneration improves the
linearity of the circuit. Roger Wilco... over and out.

>
> >The AC & DC part came in a later post... grounding grids in various

> More diversionary BS. What's a load line, Skippy?

Right here it's a truck full of poop your trying to hid. Did you
bother to look up my sweep tube text at the site mentioned above.

You seen so... good with the internet... how about having at and
getting back to me.

Remember, if your going to turn, put on your blinker... no blinker
no talkie about load lines at this time.

> >In specific, you applied the resistor recommendation to a fault of

> WTH are you talking about? I said that a cathode resistor on a
> common-cathode RF amp is a bad idea because it ungrounds the cathode.
> What does that have to do with your claim that a series resistor on
> the cathode of a grounded-grid amp improving linearity?

You were the once dancing in the spot light about resistors. My
original dentron text where this all started is still on the
sonic server as you last saw.

> > when I only state the resistor improves
> >linearity, the cause... by providing degeneration.
>
> Attenuation is not the same as degeneration (degenerative feedback).
> Go read your Electronics 101 book, Skippy.

Drop the feedback... just degeneration... all about load lines
frankie... if your going that way, take the text as I post it.
Remember to send us a post card...

> > You did not
> >properly address the issue because you don't understand AB2 grounded
> >grid circuits very well.
>
> I understand the issue very well and have previously addressed it.

I'll give you credit in the shear volume of inert gas present in
your posts.

>
> <3dcb7d8f.6835690@news.cet.com>
>
> And you are STILL avoiding the issue at hand; namely, your confusion
> between AC and DC grounding of a grid.

If you can tear yourself away from your latest tangent of AC and
DC paths, focus on the differences in the circuits which ground
all grids to the same point vs the other grounded grid circuits
which do not. This is the direction the topic should be taken
as it's a very important issue you don't seem to get
very well.

Yeah? So?

>I find few if any good beam power tube circuits with the beam forming
>plates grounded in AB2 cicuits. Buzzztt...! you lose. insert another
>quarter.

First you claim that sweep tubes are beam tubes, and that your
"classic" grounded-grid sweep tube amps are exampled by the Palomar
and Dentron. But now you say that you don't find any good beam tube
circuits where the beam forming plates are grounded as they are in
your favorite examples. ROTFLOL!

No it isn't "self descriptive". You can have spacing BETWEEN the
electrodes, you can have spacing of the WIRES of an electrode, you can
have spacing relative to the ALIGNMENT of the electrodes... Which one
do you mean, Skippy?

>> Once again, what about the electrode spacing? How is it different than

>That's a point... or two...

Then, as you said, what other significant parts of a beam tube affect
the operation of a triode-connected grounded-grid amp that are
different than a pentode? Come on, Skippy, you made the claim, now
back it up with some facts!

1504. CB Radio Parts Needed

Hi all,

Did something dumb with a CB I got secondhand. I keyed it with an unbalanced load and blew the final.

Can anybody provide a source for parts? Fortunately, the unit came with schematics and a parts list.

Thanks in advance...

mh

Aw, Skippy, did you really think that I wouldn't notice your chop-job
on my post? You didn't say ANYTHING about swamping RESISTORS, let
alone that you think that's the function of your series cathode
resistors. Here's what you DID say (and snipped):

>>Dumb answer Franklin... Sweep Tubes in grounded grid AB2 RF amps
>>can work very well. ... and I saved all that money just by knowing
>>the "feed through power" of a grounded grid circuit swamps out the
>>grid current distortion issues.

Bad form, Skippy. As for your series cathode resistors, they aren't as
good of an idea as you think, for reasons I have stated many times
already but you continue to ignore.

>Partial relief is good, your concern about linearity is noted.
>Remember the part where I said the feed through power swamps the
>grid current distortion in a grounded grid amplifiers. That
>makes the circuit a real player...

And you are missing the boat here, too. It's not the fact that the
input power is fed through the tube, it's the fact that the power is
fed at a low impedance from a tuned circuit! THAT makes the
difference, Skippy! Your series cathode resistors actually HURT the
performance of the amplifier (in more ways than one!).

OE Express does the same thing too. It's just to much screwing around
to go through the menus all the time to change it for every message.

> But what does that prove?

Nothing, but Twisted doesn't know that.

> I'm still using the same ISP, no matter what strange demons are
> slithering through his little mind.

He still doesn't know what to do with those numbers seperated by
periods, nor what they mean.

> If he would spend more time thinking about what he posts and
> concentrating on comprending what other people say, rather than
looking
> for elephants under his bed, he'd be way better off.

He spends to much of his time crawling through old Daja news archives
looking for old posts from various people that he hopes to embarrass
them with later. Of course his post about the "jockstrap" and talking
to "saucer men" can be found there as well.

> That's why I'm not going to bother responding to him anymore, it's
> pointless. He still doesn't get it, the joke's on him, but there is
only
> so much fiddle playing someone can do, before you get tired of
hearing
> the same old song and dance routine.

Twisted is point less, period. If you watch how he twists what people
say around it becomes very obvious he's constantly "Trolling". He does
this because he knows people will keep coming back and trying to
correct him. He knows perfectly well what he did and enjoys getting
people to react to him one way or the other.

> If he wants to keep searching google for every post that I've ever
made,
> and thereby validating, for the world to see, his obsession with me,

the
> past, in no way changes what he does NOW in the eyes of the law.

Which is a valid point. Several others have admited to operating beyond the law at one time or another and have since stop doing so. I have to respect that. The whole point is to try to educate people. Either by posting the facts, or through logical and civil debate on this news group. There are some, like Twisted, who will never understand that we all have to live under the rule of law if we are to have any order in our socity.

About the only time I bother with Twisted is when I'm bored and have nothing else to do. Its always entertaing to see what kind of illogical logic Twisted cooks up to support his off the wall remarks, stumble all over himself, thus living up to his sole use on this news group as the offical Punch Clown of rec-radio-cb.

That's even more hogwash! The reason you thought I was "jumping back
and forth" is because you didn't know the difference between the amps!
Even your website has several examples where you demonstrate that
confusion. So don't blame me for your incompetence!

>>
>> >Once more for the road... we've been talking sweep tubes in AB2

Turn your steering wheel back on the previous posts in this discussion
where I'm talking about both grounded-grid and common-cathode amps and
you are getting confused. Then steer yourself to all the times you
have accused me of going off-topic while you do what you accuse in the
very next post, sometimes even in the SAME post! You seem to be doing
that more often lately, which tells me only that you are desperate for
reasons to argue.

Sure, just as soon as you demonstrate an understanding of the
differences between AB1, AB2, grounded-grid, and common (grounded)
cathode amplifiers. So far you haven't been able to do that.

>> >If you want to put on the common cathode sweep tube amplifier talk,

>
>Notice the exact words "better than 10 dB..." frankie..?

I remember back in grade school where kids made up excuses like that.
Kind of like one kid would claim, "My dad is over six feet tall!", and
another kid would respond, "Oh yeah? Well, MY dad is over SEVEN feet
tall!", then the first kid would snap back, "Well MY dad is over EIGHT

feet tall!". Of course the second kid would notify the first kid that
he originally boasted about his dad being over six feet tall. But that
first kid, he really thinks he's smart, and comes back with, "Yeah?
Well, eight feet tall is over six feet tall!" Sounds like you, Skippy.

>It's actually about +13 dB gain where I operate it,

Well, you have broken some amazing new ground by building a
common-cathode sweep tube amp that doesn't require neutralization.
Matter of fact, that revolutionary! I don't see why you would ever NOT
want to brag about such an accomplishment when nobody has been able to
do what you have done since the beginning of sweep tubes....

....LOL!

Now we're movin' ...

But it is measurably slow to react to speech which very often
results in over driven amplifiers. Over driven is bad...

bad dog amplifier..! over driven..! no dinner tonight.

>
> > The Transmitter output

> the time constants. And that's a pretty good argument against trying
> to squeeze every last watt out of a rig.

My, nor most other modern amateur HF transceivers speech processors
are clipper circuits.

Without proper power control, one should not rely on the mic gain to
ensure the amp is not over driven. Indication of the amplifier to
radio ALC circuit is too late... the poop'eth hath departed.

I need not squeeze extra wattage from my transceiver...

> >The Galaxy circuit is novel in that it adjusts the amplifier bias

Kind of neat isn't it..? I thought it novel enough to place
the circuit on the sonic server amateur radio page.

> The ALC circuit, just like any other compressor, is set to react
> whenever the input reaches a specific level. That level may or may not
> be in the linear region, but the lower the better. It also has an

> driven beyond the ability of the ALC circuit to control the amp, there
> won't be ANY "poop" to deal with.

In plain brown wrapper terms... the amplifier to transceiver loop
is never fast enough (there are a few exceptions for another thread).
It should not be relied upon; especially if there is a valid power
control knob available on the radio.

> >The power control knob of a modern amateur radio should not accused
> >of causing distortion.
>
> Who did?

In one post, you alluded to the mic gain as a power control.

> ..."poop gate"?

Control your max drive.. ALC and its poop generation are avoided. If
you were using an amplifier, you might relabel you power control knob
"poop gate". Below the amplifiers max drive value... resultant poop
generation is much reduced.

>
> >> As far as their being too "slow", most of them begin to react after

> > log/anti-log amps or RF processing, but those are quite rare.

More potty mouth... oh well. Let's get back to the real world here
frankie. Most modern amateur transceivers used with the topic
amplifiers do not have simple diode clipping.

We can dance and sing about AGC type circuits being limiters or
compressors. When we talk about an RF peak clipped or limited
because of the failure of the ALC to respond fast enough,
contributions made by a speech processor mean ... more poop..!

> > A couple
> >of peaks are going to sneak through each time the ALC loop fails
> >to keep up. Poop generation in every transmission.
>

> Right effect, wrong reason. Ever read an ARRL handbook, Skippy?

I have most of the entire collection in my Library thank you.

Right effect, one of the reasons.

> the audio input to the amp, which it does. Have you thought about
> getting one of those glare-screens for your computer monitor?

If that ALC loop is a'workin' chances are good that your'a poop'n

About speech compression... sure in the pure at heart world it does
distort or modify the audio... some circuits ok, some not so ok. But
we do not equate a modified higher level of average audio as an
automatic source of rf wave form distortion. When your over driving
an rf amplifier... your putting too much rf into it.

> >Depending on ALC action most often results in over driven amplifiers,
> >dat's da fact jack...
>
> No doubt that ALC circuits are frequently overdriven. Some people just
> gotta have those extra few watts!

Your starting to read like a nice guy here frank... careful now. Any
trip down the HF bands finds bad operators "lids". Sad part is that
they don't realize a much smaller cleaner signal sounds better on the
receiving end.

>
> >RF Limiters are another animal which cover a lot of ground. Without

> screen current of the common-cathode final. What's your point? And
> what does that have to do with RF limiters?

It's actually specific to the transmitter circuit... I use a solid state
transceiver for the most part. I don't want to exit into the rf
limiter topic as it's hairier and longer than our jousts might
ever result over this bit of shuffleboard. Leave the RF Limiter
topic for another time.

> >Controlling or limiting the output power of a modern amateur radio is
> >not the distortion generation device your trying to describe....

> clipping. It distorts the signal. A compressor (of which the ALC
> circuit is an example) decreases the gain and/or input according to
> the output level. The signal remains relatively unscathed.

I'm talking about the power control knob on my modern (or semi
modern) Amateur Radio. It limits drive power, doesn't touch or
effect the audio.

The two available speech processors are not power controls, nor
do they interact with the power control function of the radio.

> >> >At one time, ALC was thought to work pretty well for the most part.

> >
> >For those who know no better and are happy with dated technology.
>
> That includes anyone that uses incandescent light bulbs, convection
> ovens, and that wonderful invention by Thomas Crapper. All "dated"
> technologies by your standards.

Some of us use the power control knob on our transceivers. Amateur
HF Radios without true power control knobs require closer attention
to prevent over driving external amplifiers.

Now who left those lights on around here..? ..! :-)

>
> >Modern radios do a better job with ALC, but it's never fast enough.
> >This is where the power control knob on the radio works better.
>

> Are you trying to tell me that you can turn a power control knob
> faster than an ALC circuit can react to power peaks? I hope not!

I'm telling you that I can set the power control on my radio to
keep the radio from over driving the amplifier. I don't bother
with the amplifier ALC wiring as its not needed.

> >When the amplifier reaches max boogie, the rf envelope is compressed

> those other posts -- you aren't ignoring them, are you Skippy?

If your using your ALC with a radio that can over drive the connected
amplifier, you are almost always going to over drive the amp in
"normal transmissions".

Yeah, Radio Amplifier connected ALC has its limitations...
its simply not fast enough. I'm not ignoring that fact.

cheers

I would imagine they might actually still pass muster, just
depends on how you present the amplifier to the FCC. People
manipulate the data every day.

> >> > The FCC said go and the various mfgrs legally built them.

> hanging onto this "dated" technology?

I just like tubes frankie... People thought my vintage Marshall
guitar amplifier was dated a while back. I'm still playing
it although its now worth more than my new car.

My latest cost on RF designed Sweep Tubes that are direct drop
in replacements for the Svetlana EL-509/519 and the actual 6KG6
sweep tube is now under $15 each.

You gotta love it frankie...!

>grounded AB2 circuit. Dat's what I'm talkin' bout frankie...

Oh, so you are saying that "tube geometry" is about how the grids are
connected? What about the Dentron? All three grids are directly
connected to ground in that amp, and it was a sucessful amp. So why do
you keep saying that it's such a bad thing to do?

>And just to add the cherry topping... it's all directly related to

>4cx250b and various Beam Power Sweep tubes. The AB2 G-Grid layout

>which connects the G1 & G2 grids as one is a bad boy for the
>4cx250b

No kidding. It was designed for specific functions, and grounded-grid triode operation isn't one of them. Kinda like sweep tubes were not designed for RF power applications.

> and many Beam Power "sweep tubes".

You said that just to get my goat, right?

>> >I do thank you, you don't appear to have a grasp of load lines when

Is this what you read, Skippy:

>2. The addition of cathode resistors (typically 10 ohms) on parallel
>grounded-grid tubes is used to equalize the cathode currents between
>the tubes, a practice which Skippy considers "dated". They do NOT
>cause degenerative feedback as they do in common-cathode amplifiers,
>and therefore do NOT improve the linearity of the tubes. Quite the
>contrary: A cathode resistor on a grounded-grid amplifier -increases-
>the impedance of the signal source by the value of its resistance, and
>therefore -increases- the distortion caused by grid current. Any
>grounded-grid amp designed with cathode resistors is not intended for
>linear AB2 operation. If it was, then it was not designed properly.

If you didn't read that then you need to do as I have suggested many times: upgrade your news browser, or log onto google and catch up on the posts you missed. Because without knowing what was written you are really looking like a fool. I don't mind you looking like a fool, but I would rather it be by your technical foolishness, not because you were uninformed. So get informed, Skippy.

> I don't care to waste time
>explaining load lines here...

There's those words again -- "don't care". Synonymous with "don't know".

> but the resistors function by providing
>degeneration to the circuit; said degeneration improves the
>linearity of the circuit. Roger Wilco... over and out.

Degeneration does improve the linearity of an amplifier, but your
resistors don't provide any degenerative feedback -- they attenuate
the input signal. If you want degeneration in a grounded-grid amp you
need to put the resistor between the grid and ground, where the signal
imposed on the grid will oppose the amplification of the tube; and
just like a cathode resistor on a common-cathode amp, that's not a
good idea for RF applications. Nor do your resistors provide a
'swamping' of the input, because they are in series with the cathode
and INCREASE the impedance at the input of the tube.

Jeez, Skippy, will you ever learn?

>> >The AC & DC part came in a later post... grounding grids in various

Just because you used them doesn't mean they perform according to your
erroneous expectations. You don't describe how they allegedly improve
the linearity, you just say they do without any further explanation.
Do you think that people should take your word on blind faith?

>> > when I only state the resistor improves
>> >linearity, the cause... by providing degeneration.
>>
>> Attenuation is not the same as degeneration (degenerative feedback).
>> Go read your Electronics 101 book, Skippy.
>
>Drop the feedback... just degeneration... all about load lines
>frankie... if your going that way, take the text as I post it.
>Remember to send us a post card...

Then explain your concept of load lines and how series cathode
resistors cause degeneration. And you might also explain the
difference between 'degeneration' and 'degenerative feedback' (and
'negative feedback' also, since all those terms are synonymous).

>> > You did not
>> >properly address the issue because you don't understand AB2 grounded

Alright then. If a grid -- any grid -- is bypassed to ground, is it
not grounded?

> the circuit, Skippy!

Well frankie, let me take the liberty of pasting in some text which
clearly lays it out. Enjoy another crow dinner...

[cut and paste]
The 8877 is well known as a *stable* tube for amplifiers at 50MHz and
144MHz.

With the input and output both tuned to the same frequency, and
typically 15-18dB of on-frequency gain, it's stable. If you provoke it
by removing both the input and output loads and swinging the input and
output tuning, a well-constructed 8877 VHF amp will still not oscillate.

Why? Because the 8877 has a grid ring that makes a very direct,
low-inductance connection to the actual grid inside (a sheet-metal cone
which very effectively shields the input from the output). If you ground
the grid VHF-style, with finger-stock contacts directly on to the grid
ring and fixed directly to the chassis, then the tube will not oscillate
at VHF. This applies equally to an 8877 in an HF or a VHF amplifier.

For glass tubes without a grid ring, such direct grid grounding is not
possible, which is why we have to use Plan B - parasitic suppressors -
to reduce gain at VHF.
--
[end of cut and paste]

some steak sauce for your crow frankie..?

> grounded-grid amp because of 'grid-screening'.

Nothing I can find on his web page is faulty... his grid screening
text agrees with my Eimac Engineer Authored "SAI" Handbooks and
my opinions. His weab page goes through almost daily review by
people on the cutting edge of current amplifier technology. He
has many published articles on the subject of tube rf amplifiers.

I feel pretty safe agreeing with him and my books, you keep
your incomplete dated text book opinion for yourself.

> >For more detailed study of a tube which is not generically subject
> >to parasitic problems, please research the 8877, in specific...
> >the grid construction. The mfgrs data sheet might be a good

1516. SBE / KeyComm 1000

Newsgroup: rec.radio.cb
Date: 2002-11-15 23:13:57 UTC
From: 240-Robert <singram@direcway.com>
Message-ID: <dcfB9.17119$NV.318245@news.direcpc.com>
Source record: 144052

Hello, this 240-Robert from Central Virginia, USA.

I picked up this SBE - Keycomm / 1000 at a flea market in Danville, Virginia for $2.00

I am looking for a manual with schematics on how this radio functions.

If someone can scan it that'll be fine
Or if someone doesn't want the manual and wants to sell it - that'll be fine too.

It's got power when I turn it on
The power connection is straight to the board via red and black wires sticking out the back -not the conventional connection like you would find on a Grant or Radio Shack CB or a Ham 2 meter mobile that has the connector built in to the framework.

That's no biggie I just replace the wire with the exact gauge/current rating and fuse both red and black for good measure.

And, also I would like to find the original 4-pin mic that may have been with it -or- a another 4-pin mic to replace it with in reference to the numbers and the pin-outs!

The front of the rig is mostly a keypad and a display with amber - RCV and red - XMIT
It scans when the SQL. is closed.
The power knob is just to the right of the display

There are pictures on the internet of this radio to give you a better understanding of the description I have given.

I would like to find a website with Nothing else but this radio and other models with SBE on them so that I can
figure out the keypad functions.

I'm going to look up the FCC ID --if it even has one.
(Know what I mean? nudge-nudge, wink-wink, say-no-more)

email me by clicking on the e-mail address below
singram@direcway.com

And Tnx in advance :)
73s
Out.

Actually very funny... still doesn't say the amplifier's target
is the US CB market... and they are made in Italy I believe.

So rather tongue in cheek, can we do anything technical with this
thread... or do we just laugh it off?

> > OK,
> >so I couldn't resist one time. Now lets break it down...

> reception.

Well now... throwing in that last part "audio reception" is a pesky
fly in the soup.
How about I sum it up in the real world again... I and thousands of
others have commercial receivers that need to hear very weak signals.
We all (most of us at least) have fet preamps in front of them. Our
receivers easily hear better than 1 uV. We depend on the lower noise
figure of the preamp circuit. Advantage, use the preamp...

> >Conditional statements side step the applied real world.

> >> >tried have pretty numb receivers.

You tried a new 706MKIIG radio frankie... I have one myself and it's
numb a rug on the lower bands. I actually consider it useless on the
160 meter amateur band when compared to other radios I have.

> >I don't agree... neither does most of the rest of the world. That's

> >and butter.
>
> Most of the world accepts certain things on blind faith simply because
> the claims are too good to be true. Anyone that has actually put these
> through the bench know better -- same deal with sweep tube amps.

Many of the people I reference as the VHF and weak signal crowd
are also highly educated RF Engineers for companies like Agilent, AT&T
and similar "level" companies or agencies. Many of us meet in Dayton
each year where my friend Tom (works for Agilent in their RF Test
Equipment Division) totes in the latest high dollar test equipment to
specifically test low noise preamps people have bought or made.
Many are hand made by some very wacky looking people...

No one takes the results on blind faith.... they see the readout
on a $70,000 plus cost piece of brand new Agilent test equipment.

I had a second cup of good coffee while my preamp was under test.

> >the rest of the tube that have VHF gain.
>
> You are still confusing neutralization with parasitic supression.
> Learn the difference, Skippy. Then we'll talk.

It just matters where the feedback path is happening. If there
are two paths we just tend to label it parasitic. Doesn't have
to be in the VHF region. A vHF supressor won't stop the fun.
Nor will relying on the non inverting layout of the amplifier
circuit.

> >But you have "yeti" to show us that you understand the VHF issues

> (or parasitics). Once you have identified where they are coming from
> and their frequencies, it's a simple matter to eliminate them with any
> of several methods, and the common resistor/inductor supressor is only
> one of those methods.

Nothing is really as easy as you appear to describe it. Parasitic
suppression is a science unto itself. Taming all the gremlins
in a high gain circuit using a tube with respectable Ft can
become a chore. You should know that by your supposed experience
in broadcast transmitters. But if you examine some circuits with
tubes like the 8877 in operation, you'll notice they don't
require parasitic suppressors.

> That's how amplifiers are PROPERLY designed, Skippy. Not by picking a
> tube because you heard somewhere that it doesn't require parasitic
> supression. That's lazy and lame.

And done every day in the real world by using an 8877 A lot of
experienced and well qualified rf engineers must be lazy and
lame.

> And you STILL haven't shown any understanding of the fundamentals
> behind neutralization.

Cute, but no cigar Frankie. Come back after you've had your
crow dinner and we'll again review a tube that doesn't require
parasitic suppressors... that would be the 8877

> >Neutralization in the HF region goes out the window to ensure stability
> >in the vhf region. There are two different paths happening...
>
> No screamin' eagle [poop]! What do you think I have been saying for

>
> >By golly I must know something... every single grounded grid amplifier
> >I own or have built (which are many in number) does not have one part
> >of a neutralization circuit on board.
>
> Care to guess why?

No guess, the composite contributions of the circuit layout which
include the reduction of C by the grounded grid. The in phase
relationship is only a player who can be removed from the game
if your not careful.

Don't take my word for it frankie...
If you really want to debate the topic, your generous assumption
that the non inverting function removes the neutralization requirement
for grounded grid amplifiers.... which is also contrary to statements
and information provided by Ameritron Amplifier Designer, Tom (w8ji);
of which you can easily review by searching at www.contesting.com with
your magic carpet web browser.

> >No one here claims neutralization is used to prevent parasitics. But
> >most all of us owning or building grounded grid amplifiers (with the
> >exception of some much debated Ameritron circuits) don't have a lick
> >of a neutralization circuit installed.
>
> Yeah? Isn't that what I said over a week ago? Duh!

You like to beat a dead horse...

> >Why wasted the hardware, it's simply not required in most grounded
> >grid amplifier designs. Of course unless you and _____ say it
> >is.
>
> What wasted hardware? Common-cathode amps don't have the impedance
> matching requirements of grounded-grid amps, so there's some wasted
> hardware for ya, Skippy.

whoops.... you forgot your turn signal again... get off that cell phone
and note that we are now also talking about common cathode amps.

Don't most of the real world common cathode amplifiers made have some
type of frequency selective circuit..?

Taking your hard line approach to compare simple rude designs.. I
can drive the grid swamped common cathode amplifiers through cap.
I can also drive the g-grid amp cathode through a cap...

Tis not the best method for ether layout. Now add the proper
care and feeding drive circuit... and the grounded grid circuit
still does not need the extra hardware in most cases.

onward...

Funny, my text book on the subject says just what I wrote above.
Radio Handbook 17th edition I believe (the green covered edition).
Authored by William Orr, an Eimac Engineer (rip sk).

> >> 3. Since your sweep tube is connected as a triode, the screen and

Palomar 300 (the six tube version)... reference it and we'll talk it
over.

>

> "classic" grounded-grid amp has all three grids GROUNDED!

Now we see "RF bypassed to ground" as part of your text. First off,
it is not what I call a classic grounded grid amplifier so don't
misstate what I write.

"Grounded for AC only", "You still don't get it do you frankie?" you
don't still don't appear to know the G1 grid must not be tied
with the G2 (and G3) when using certain geometry type tubes like
the 4cx250b and what the difference in the grid potentials do
in actual ac signal operation.

>
> >I'll put aside your Cgp statements for the moment until you review

> measurement of the effective Cgp of a triode-connected 6LF6. You can
> verify the measurements for yourself.

Yes, the 4cx250b is not made for grounded grid operation, but you fail
to state why. The tube geometry as with sweep tubes does not well
support all grids AC and DC grounded AB2 operation.

Actually, with a bit of proper circuit design, the 4cx250b can operate
grounded grid... circuits are depicted in handbook projects through
the years.

> >Your plane just crashed frankie...
>
> Get ready with your excuses because it's YOUR plane that's going down
> tomorrow, Skippy.

You must live for this stuff Frankie... That's ok, even though I
might not follow up until Monday, I'll might still go up in a 172
this weekend without fear of you shooting me down. Watch for
my moon sign...

>
> And ONCE AGAIN you are confusing neutralization with parasitic
> supression!

For this topic, lets call Parasitics a two path resonant amplifier
problem and the regeneration subject part of the lower path or a
single resonant path problem. I and others say the non inverting
circuit operation is not the all encompassing fix for regeneration
problems. Tom, the Designer of Ameritron amps feels he has enough
proof that he adds hardware to many of his grounded grid designs.

Don't take my word for it... go look Mr. happy...

Mr. Measures is a pretty well known published author on the subject,
so was Mr. Orr (an Eimac Engineer). How about you giving us some of
your reference material and the date that it was published..?

> >You'll grow old waiting for Frank to post any articles of text
> >he's authored. Even though I said please numerous times.
>
> Ain't my bag.

So you will continue to post dated information which has flaws
here on the news groups...

:
: >Not really. The roof, as an example, can act as one of those plastic
: >spacers that are always disarded, changing the entire equation.
:
: That's why I suggested the second magnet.

That's nice a mag mount with no ground plane, as stated a 102" whip on the
bumper will work better than that.

:
: >>The bigger problem is that those antennas >need the ground plane of the
: >>roof to work >right.
:
: >Absolutely.
:
: Nothing some copper tape can't fix, but it's a PITA.

Dave how much copper tape do you think he will really need ? Do you think he
will get a good SWR? Do you think the swr will be better than what he has
now? a 4' x 6' sheet to do the inside of the roof would be nice, but that
probably costs how much $150.00? but forget all that he may have a nice van
with the lites inside and carpet on ceiling etc from the sound of it? But
why do you insist on trying to put an mag mount antenna on the roof of a van
with a fiberglass top? he may have a ladder going to the top as many of
those type vans do, or he can still mount a top loaded Firestick to the
bumper or side of van with a ball mount any of these options will out
perform the mag mount abortion on the roof.

:
:
:
: >>He might be better with a marine CB antenna, >they are designed to work
: >>without the ground >plane.
:

:
: >I had a 4 foot one for the longest time before just strapping up an
: >antron when asea. Huge difference..the small ones suck for cb, but his
: >options do seem a bit limited.
:
:
: I have a similar problem with my rig, even though I'm running VHF and UHF,
: the antenna ends up at 11' off the road. Comet and Maldol make powered
: mounts that will raise and lower the antenna at will. $100 per mount, but
: I'm seriously considering it, since my antenna has no springs or other
: "give" mechanism. If I hit anything, something's gonna break, and it might
: be my roof!

:
:
: Perc',
: Using a 102" whip on the bumper is about as
: inefficient as a base loaded shorter antenna.

Somewhat, but more of the antenna will be out in open and I did also mention a ball mount on side of van with a whip the higher it can be mounted the better of course.

: Rather than loosing anything in a coil, it looses
: it by being as near the van body as it will be.

Well losing it in a coil and next to the body as the k40 was, then the 102" should still outperform it and a mag mount on the roof.

: If both antennas were mounted in the 'clear', I'd
: probably agree with you,

I would hope so proven fact.

but with how the ship
: would be mounted on the bumper, there's just not
: a lot of difference in efficiency...
: 'Doc

Doc a coil and being placed on the bumper it inherits the same losses the 102 will and the 102 should outperform it on the srength of length and the fact of more will be out in open away from Van drive down the road what happens to the whip? It bends back away from the van. I am not saying it is the best way to mount a whip but it sure beats mounting a loaded antenna on the same bumper, or a mag mmount on a fiberglass roof. It is also the cheapest, Doc I am sure you have seen where some of these screwdriver antennas are mounted

I solved the problem!!! And here's how I did, kinda easy actually. I went out, bought a Galaxy 88...AM/FM/SSB and got it worked on by a well-trusted and very good tech. I set the antenna up on my 79 Trans Am on the trunk, ran 18 foot of coax back to my radio, and talkin skip on SSB, reached four different people...in Georgia, Oklahoma, Texas, and my personal favorite....Australia. FM and AM are talkin fine too. Got the echo and roger beep already on it and everything works beautifully. I have a great ground and SWRs are 1.1 on 1, and 1.3 on 40. I am one happy CBer and if you wanna talk, look for ID391 or handle "ET" in Idaho. Ya'll have a good one....Jason

> Mike Roe Farad wrote:
> > I've been up and down a lot of interstates lately, and hardly hear any
> > traffic on channel 19 anymore.

weird, it's there for ME.

i tend to hear CB traffic as follows:

Channel 17 North/South freeway traffic and trucks (except in
California where all traffic is on 17)
Channel 19 East/West traffic and trucks
Channel 30 and above SSB (There seems to be a bootlegger's gentleman's
agreement that long distance SSB be done above channel 30)

i just finished a 4-hour run and there was nothing but chit-chat and
traffic-reports on 19...

> > Have the majority of them moved to a new
> > "freeband" frequency?

not really, although i used to hear some licensed HAM/truck drivers on
amateur VHF "state-nets" last year...

> >It seems every time I pass a truck, they're
> > talking somewhere because I can hear them bleed over onto channel 19.
> > But I just can't find where they're talking.

maybe they're off-frequency? too much gain? crappy mod? who knows?

CB Channel 19 is alive and well in the Dallas/Austin/San Antonio I-35
corridor...if you don't believe me, turn the dial to it, then wreck
your car into a jersey barrier on the interstate...

while you're waiting for the police to get to you (they have to drive
through the 700 cars and trucks you just piled up behind you), turn up
your CB radio and listen to all the truck drivers talk about your
shitty driving...

>> to squeeze every last watt out of a rig.
>
>My, nor most other modern amateur HF transceivers speech processors
>are clipper circuits.

For SSB speech processing you MUST have some clipping, whether it be
with the hard clipping of diodes or the soft clipping of an AGC
circuit or log amp. But the whole concept of SSB speech processing is
based on the elimination of audio peaks above the normal level of
speech that will overdrive the amp, and the ONLY way to do that is by

clipping.

>Without proper power control, one should not rely on the mic gain to
>ensure the amp is not over driven.

You STILL don't understand the fundamentals of SSB modulation. The RF
level varies at the rate of the audio -- the audio IS the power
control.

> Indication of the amplifier to
>radio ALC circuit is too late... the poop'eth hath departed.

So hath your wit.

>I need not squeeze extra wattage from my transceiver...
>
>> >The Galaxy circuit is novel in that it adjusts the amplifier bias

>> No kidding -- it improves linearity by pulling the amplifiers out of
>> saturation and back into the linear portion of the EgIp curve.
>
>Kind of neat isn't it..? I thought it novel enough to place
>the circuit on the sonic server amateur radio page.

Nothing novel about it. Just an application of basic principles that's
been done for a very long time.

>> The ALC circuit, just like any other compressor, is set to react
>> whenever the input reaches a specific level. That level may or may not
>> be in the linear region, but the lower the better. It also has an
>> attack time that must be set -- again, the lower the better. Provided

>> won't be ANY "poop" to deal with.
>
>In plain brown wrapper terms... the amplifier to transceiver loop
>is never fast enough (there are a few exceptions for another thread).

The loop is not from amplfier to transceiver, it's from input to
output. No ALC circuit that I know of controls the power of the
exciter.

>It should not be relied upon; especially if there is a valid power
>control knob available on the radio.

It should be used according the the manufacturer's recommendations. If
the manufacturer says not to drive the ALC too hard, don't.

>> >The power control knob of a modern amateur radio should not accused
>> >of causing distortion.
>>

>> Who did?
>
>In one post, you alluded to the mic gain as a power control.

And it is. And I did not accuse it of causing distortion. You have
misquoted me AGAIN.

>> ..."poop gate"?
>
>Control your max drive.. ALC and its poop generation are avoided. If
>you were using an amplifier, you might relabel you power control knob
>"poop gate". Below the amplifiers max drive value... resultant poop
>generation is much reduced.

The mic gain has the same effect. It's even in the manual for your
Swan 350.

>>
>> >> As far as their being too "slow", most of them begin to react after

>> >
>> >Most modern amateur speech processors are not limiters.
>>
>> The hell they aren't! Most of them work by simple diode clipping and
>> subsequent filtering. Some work via fast AGC circuits which have the
>> same effect, but with less filtering required because of the soft
>> clipping of an AGC amp. There are a few speech processors that use
>> log/anti-log amps or RF processing, but those are quite rare.
>
>More potty mouth... oh well. Let's get back to the real world here
>frankie.

FYI, there is a lot of profanity in the "real world", and much worse
than "hell". What world to you live in, Skippy? Did mommy and daddy
shelter you from all those bad people that say all those bad words?

> Most modern amateur transceivers used with the topic
>amplifiers do not have simple diode clipping.

Diode clipping and filtering is, and has always been, the most common
method of speech processing for SSB modulation. The proof is in the
schematics.

>We can dance and sing about AGC type circuits being limiters or
>compressors.

An AGC amp can do both -- it depends on the response speed.

> When we talk about an RF peak clipped or limited
>because of the failure of the ALC to respond fast enough,
>contributions made by a speech processor mean ... more poop..!

No ALC circuit I have ever seen had such a slow response, hence my response saying that "I suppose" it could happen. What I HAVE seen are ALC circuits that are too weak to hold the RF down (of which the Swan is a good example), or have a threshold that is too sharp causing the RF to spike (which I believe was was a Motorola, but I also remember that the spike never got past the low-pass filter, so no harm done).

>> > A couple
>> >of peaks are going to sneak through each time the ALC loop fails
>> >to keep up. Poop generation in every transmission.
>>
>> Right effect, wrong reason. Ever read an ARRL handbook, Skippy?
>
>I have most of the entire collection in my Library thank you.

Try reading them. Start with grounded-grid amplifiers, work your way up to neutralization and parasitics, and check out amplifier input feeds on the way. After that, educate yourself in the fundamentals of SSB modulation, and also learn how most speech processing is done. If your ego isn't shattered by then, flip back a couple chapters to vacuum tube fundamentals and learn how to read an EgIp graph. By then you should be able to describe load lines instead of having to post more of your avoidance BS. You should also be able to determine the linearity during transistion into grid current conduction. And if you aren't too bored with these facts maybe you can do a quick overview of resonant and non-resonant filters, paying special attention to pi tanks and LC filters.

>Right effect, one of the reasons.

Your 'reason' is based on flawed information. Like I said, try READING those manuals instead of just collecting them so you can show them off to people to give them the false impression that you actually know something when you don't.

>> >> >Many Amateurs using ALC are clueless about the actual

>
>If that ALC loop is a'workin' chances are good that your'a poop'n

You whine about me saying 'hell', yet you make constant references to
feces? You are not only a technically incompetent liar, you are also a
hypocrite. Just like the way you accuse me of trying to change the
subject when you do it yourself, or how you accuse me of editing your
quotes but you snip very relavent material from mine and reply as if
it wasn't there. Matter of fact, check out the very first reply to me
in this entire discussion. You called me dumb, ignorant, and twice
called me stupid. And YOU have the gall to say that -I- am rude or
have a potty mouth? What a pathetic piece of trash you are, Skippy,
and I'm more than happy to point out every single shred of technical
bullshit you spew! You can whine about this paragraph, too, and I hope
you do because it only reinforces everything I just said. So go ahead,
Skippy, whine away!!!

>About speech compression... sure in the pure at heart world it does
>distort or modify the audio... some circuits ok, some not so ok. But
>we do not equate a modified higher level of average audio as an
>automatic source of rf wave form distortion.

I did NOT say it was an automatic source of RF distortion. I said that
speech processing (not compression) for SSB requires clipping, which
IS an automatic source of AUDIO distortion. You misquoted me AGAIN.

>When your over driving
>an rf amplifier... your putting too much rf into it.

At least you got that much right.

>> >Depending on ALC action most often results in over driven amplifiers,
>> >dat's da fact jack...
>>

>> circuit is an example) decreases the gain and/or input according to
>> the output level. The signal remains relatively unscathed.
>
>I'm talking about the power control knob on my modern (or semi
>modern) Amateur Radio. It limits drive power, doesn't touch or
>effect the audio.

What does that have to do with your confusion between 'limiting' and
'compression'? And didn't you say you wanted to drop this topic?

>The two available speech processors are not power controls, nor
>do they interact with the power control function of the radio.

Now where did I say that the speech processors are power controls? I
didn't. You misquoted me AGAIN.

You know what, Skippy? This whole conversation has been nothing but
you misquoting my posts, changing the subject when things get too
complicated, tossing out stupid catch phrases when you have no idea of
what you are talking about, etc, etc, etc. Is this your normal
behavior, or did you go to a special school for the technically
handicapped?

>> >> >At one time, ALC was thought to work pretty well for the most part.

>with the amplifier ALC wiring as its not needed.

If you can keep the peaks from clipping without an ALC circuit then
you probably don't need one. But most people do not monitor their
signal on a sampling o-scope, either.

>> >When the amplifier reaches max boogie, the rf envelope is compressed

>to redirect the topic from the original subject... sweep tubes
>in grounded grid amplifiers.

Your attempt at 'truth by repetition' isn't working, Skippy. Here is
the original subject:

>Hey Skippy, you have a couple questions outstanding yourself: What
>services between 25 and 34MHz are allowed to manufacture and market
>power RF amplifiers? And what make/model of television used the 6146
>as a sweep tube?

After all this time and effort, waddling back and forth on both
issues, and desperate attempts to distance yourself from your own
claims, you STILL can't provide a valid answer to those questions.

>If you want to dance a specific tune, play the music and stay
>in the same room. Otherwise, please tell us where your going
>when you leave.

Check this out: I referenced the Swan 500 early in the conversation.
You knew that the radio used common-cathode amplifiers. Therefore, you
knew I was talking about common-cathode amplifers. Now quit avoiding
the topics with your insessant whining.

>> >Variety is the spice of life.... even Handbook projects using RF
>> >power tubes are not specific to one single type of valve.
>> >
>> >Life goes on...
>>
>> Yeah, but the life of sweep tubes is just about over. Why are you
>> hanging onto this "dated" technology?
>
>I just like tubes frankie... People thought my vintage Marshall
>guitar amplifier was dated a while back. I'm still playing
>it although its now worth more than my new car.

So your amp is useful despite its age. So are light bulbs. So are voltage equalization networks. So is the fundamental circuit operation of a grounded-grid amplifier. Enough with the "dated technology" excuse. Now go use it somewhere else because it's finished around here.

>My latest cost on RF designed Sweep Tubes that are direct drop
>in replacements for the Svetlana EL-509/519 and the actual 6KG6
>sweep tube is now under $15 each.
>
>You gotta love it frankie...!

Cheap tubes to be used in cheap amps for cheap people. I never said anything different.

Anyone in here going to the Fort Wayne, In. Hamfest?

Well, Once again, I was asked by another friend of mine, James W8WW to help him run his table at the fest, both days. it's 12:37a.m. and I got to be at james's place at 3:00-3:30ish this morning... This is going to be of those LOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOONG days! anyhow... I dunno who's going to be there... Doug? Keith? anyone else?

Heck, I'm even going to get paid for my services too!

I can see it now.... "GET YOUR AMP TUBES HERE!"

and as usual, I shall be wearing my trusty ol' White UAW hat and my currently raddy looking UAW t-shirt. I shall be somewhere in area 5... in the arena.

Looking forward to meeting some of the posters and lurkers!

Anyhow, see ya'll there this morning...

-Chuck K8CPA

Good saying Twist...even if it was pirated. ;) But I have yet to figure out ol' Frank. Seems that he's always on the defensive for some strange reason. A few posts ago, I merely said, "Have a nice Thanksgiving... and don't eat too much." And of course his paranoia responded with, "Why?...are you trying to pick a fight?" Oh well, I guess that some folks are just wrapped a little TOO tight. And as for you Frank (I know you're reading this) RELAX a little. The sky is not falling because some people are 'Freebanding' or even running linears. Folks have been doing this since the inception of Citizen Band radios. Do I do it? NO. Do I condone it? NO. But I really don't care what other people are doing either. Hell Frank...there are amateur operators running amplifiers in EXCESS of 1500 watts PEP, and they are even running 'Pirate' broadcasts on 6955 kilohertz USB. So do us all a BIG favor. Jump on up to rec.radio.swap and chastize them ILLEGAL hams for selling gear that is quite obviously against Part 97. And take your boy Aaron with you. Nuff said....thanks for reading.

> couple Johnsons, a couple Collins, etc. Some were better than others.

My goodness and old P&H... those 837's were a pain to find back in
the 70's. Gonset made both good and bad, some of it will never
die unless you shoot it. Your right, some are much better
than others.

> And BTW, no broadcast transmitter I have ever seen used a
> grounded-grid anything, except for a couple low-power antiques that
> take up the better part of a room. Matter of fact, I own one of those
> antiques, an AN/FRT-39B.

Know of one on the air right now honking away on 95.3 from Mt Vaca.
I helped put the station on the air. Has an 8877 tube, the one
you can operate with no parasitic suppression because of the way
the tube was designed.

> >> > The predominant class of grounded grid

>
> YOU made the statement that AB1 operation of grounded-grid amplifers
> does not consume input power, and now you want to back out of that by
> crying about some "magical" grounded-grid AB1 amp? Lame, Skippy, lame.

Are you again trying to make something from nothing..? Let me be more specific for your benefit... input power meaning drive power. I probably should have said drive power from the start, but we were talking about grid current in AB1 and AB2... where most people would not flip out over the specific label. So now you know exactly what I'm talking about. Input drive power with grid current flow indicates AB2 operation for most people.

> But it's not "magical" at all. As I have pointed out earlier, your
> grid is normally biased 5 to 10 volts negative to the cathode, giving
> you at least some area under which no grid current flows, yet still
> consumes power from the input source. And just to point out what used

> been used as front-end amplifiers in receivers, and they were used
> with the intention of providing a low-impedance input to the receiver.
> Works very well! Now if no input drive power is consumed in a Class A
> amplifier, then the input impedance would be theoretically infinite --
> just as if it were common-cathode. But it's not infinite; it's a low
> impedance usually around the impedance of most transmission lines.

We're still talking Grounded grid amplifiers here frankie... If grid current flows, AB2 operation is defined for the tube. If your trying to nit pick into the very small portion of the overall wave form where the grid current is near zero.... then your really chasing wind mills Frankie. Every text book, amplifier person, article and paper I know defines AB2 operation as the point where grid current flows and power is consumed at that time. Not one of them picks the conduction angle into pieces to shout AB1 for that very limited portion of the wave form...

AB1 circuits deal with developed grid voltages. I just figured out where your going with all this... Let me be more specific so you can relax.

One must consider an AB1 circuit to consume a very very small amount of drive power. So small compared to AB2 operation that one must always consider the actual AB1 grid dissipation, often given in milli watts for many RF power tubes. The majority of the driving signal is used to develop the required grid voltage. Many and or most text books should

define AB2 operation as the point where grid current flows,
drive power is consumed compared to the fractional wattage
power level of an AB1 circuit. Most AB1 people worry more
about staying within the fractional wattage grid dissipation
rating of the tube. A general statement many people make
is to say AB1 does not consume drive power because of
the fractional wattage drive levels required.

That should get your motor running smooth frankie.

> Now go find your Electronics 101 book and start reading it already.

You should feel better now, I nit picked it for you.

> >Keep this handy because it's helpful when talking about grounded
> >grid amplifiers.
> >
> >AB2 operation, grid current flows, drive power is consumed. The
> >feed through drive power swamps out the grid current distortion
> >issues.

> AC current flow in series with the signal source then the signal
> source is loaded by the tube. Check it out, Skippy. You know I'm
> right, you just refuse to check the facts for yourself. Actually, I
> think you are just arguing for the sake of arguing, since you aren't
> even providing any facts, just lame opinions.

Well... bartender! Now that I know where your going we can again
dance... still my lead. See my text above about the fractional
wattage grid dissipation of AB1 operation. You were just trying
to hide in milli watts and I didn't see you way down there, because
we've been talking about Grounded Grid Amplifiers which Run AB2.

Now that I realize what your using micro and milli watts to scratch
out a point about AB1 operation.... I still care about you. :-

>
> >Back latter for number 18 ... gotta' go check my reverse screen
> >current.
> >
> >still love ya frankie...
>
> Of course you do. I'm the only one that gives it to you straight!

You sure give us a lot of something... I still don't agree
with a lot of it... you ever going to explain those grids tied
to the plate statements to me..?

> Still trying to avoid the issue. Oh well.

You seem rather quiet about your grid plate disaster... I've
already detailed it out. Tie the grids together at ground
and you have a potential trouble spot for sweep tubes.

> BTW, what I said was that you can tie the SCREEN to the plate, not the

"Screen grid" I was never talking about audio amplifiers in the
post, you just pooped in your pants... right in front of everyone.

It's bad enough...

> You care little about book definitions when they contradict your own
> preconceived opinions. You have proven that many times.

Books are not always the best final word. Like your statement
about adding equalizing networks across rectifiers. It's in
books but its also old dated technology that should go away.

>

> "don't care". Not suprising, Skippy. Ever hear of the term, 'passive
> agression'?

Not in grounded grid amplifiers. Grid current doesn't change the
mu of the tube, never said it did.

> Are you forgetting that all your examples have all three grids
> grounded?

Only low impedance for the "AC" signal. If you really want to get
into the nuts and bolts... a better grounded grid High mu circuit
has a rather unique G1 connection tapped into the input circuit.
The circuits function would be to provide proper division of
excitation. Resultant grid dissipation is much less.

Fun for the whole family...

>
> > Even rf power tubes like the 4cx250b
> >will have problems.
>
> Probably because the 4CX250 was not intended to be wired as a triode
> even in grounded-grid operation, or hadn't you thought of that?

As with most things... there is a alternative approach... the
tapped input circuit I mention above would allow a 4cx250b
to work very well in a grounded grid circuit.

> > It's all explained in many of the handbooks,

> acting like a triode, and then say that you never said such a thing.
> And I'm proving you wrong yet again, Skippy.

If you used the three common grounded grids connection layout, the
sweep tube would not act like a triode... it's probably going to
have destructive values of grid and screen current at full boogie
and possibly fail. A triode would not have that problem. Simple
enough..

>
> >> "Triode operation is a bit liberal..."

Because it would not be operating safe and stable.
See the above...

> > You mentioned that layout yesterday in one of your
> >ramblings... it is not the best grounded grid connection scheme
> >for Hi mu tubes in AB2 circuits.
>

> the pins and tell where they go.

Sure... tap the cathode input circuit with the G1 grid to provide
for the proper division of excitation.

> And it's funny that your current answer isn't even close to your
> answer the first time, where...

The grounded grid amplifier has many possible tube connection
schemes. Everyone has its pros and cons...

> >See the above and enjoy your crow dinner.
>
> See the above and address the issue instead of changing the subject.

I did and there are feathers on your shirt...

AC ground... not DC ground. Better circuits are available as
described in the #4 or 18 follow up thread. But the Palomar
Circuit works pretty well.

>
> >> > So again, check your

> beam tube, even when it's connected as a triode! When are you going to
> get that through your thick skull, Skippy?

I guess William Orr, the Eimac Engineer, Published amplifier
author R. Measures, the text books I have have here and myself
are wrong. We must all have the same wrong information.

> >And what is the date of your magical textbook frankie..?
>
> ROTFL! You put both your "magical" put-down AND your "dated" argument
> in the same sentence! You must be desperate...LOL!

No, I wanted to know the publication date of the text book
your holding so dear to your heart.

> > The actual
> >issue here is that the entire "in phase" statement goes out the window

> >blocking cap to the Tune C. Your HF neutralization cap doesn't
> >address the VHF Path.
>
> AGAIN you are confusing neutralization with parasitic supression!
> Maybe it's not confusion, maybe it's a deliberate obfuscation...

No, I was clearly talking about the resonant VHF path in an
amplifier. I was also clearly talking about the failure of a
neutralization cap to address the VHF resonant path, regardless
of the amplifier being in phase and grounded grid.

> >Now if you want to argue the term regenerative feed back vs parasitic
> >path... the call is made by where the oscillation happens. Care

> fritz, let me clue you in: One is caused by regenerative feedback in
> the amp as a whole, and occurs on the frequency to which the amplifier
> is tuned. The other is caused by unintentional (and frequently
> unexpected) resonant conditions in the sub-circuits of the amp (and
> NOT just the tube!). Now do you think you can figure out which is
> which?

I say the non inverting function you tout "as the main reason"; is
not the regenerative feedback cure all claim it to be.

THE REAL FACT FRANKIE IS:
Neutralization is most often not required because of the
regenerative feedback path which is the plate to cathode
capacitance is ordinarily very much less than grid to plate
capacitance... in the HF region.

Now park your non inverting fire dance and get on with
the show.

> >Hence we have well known grounded grid amplifiers using RF power
> >tubes which have well documented histories of becoming rather
> >large oscillators. The SB-220 and the TL-922 are such animals.
>
> Were those oscillations parasitic or on the tuned frequency? Are those
> grounded-grid amps? What kind of parasitic supression did they use?
> Any? Did they take your advice and build an amp without any parasitic
> supression? LOL!

You are a case... a case of denial. Most of the reported
problems were parasitic, both the listed are grounded grid circuits
and both had choke and resistor/inductor supressors installed.

Not with the 3-500z, but many of them built 8877 amplifiers
without parasitic supressors installed.

> >> I should add that the example circuit in the book is a triode, NOT a

> power amplifiers and their applications, try here:

Same Handbook I mention above.. Page 183, section 1.

> http://www.ideas2actions.com/svetlana/techbulletins.asp

Many Svetlana tech bulletins have serious short comings. Compare
my Dentron update text to their project conversion and you'll
see exactly what I'm talking about. The known short comings
of that article make a rather long list.

> >> Not. You haven't read the post with the info from the Eimac
> >> datasheets.
> >
> >Actually, I got my information direct from an Eimac Engineer. Actually
> >his data.
>
> Then he hasn't read the datasheets or tested it for himself, and you
> should have verified his information by testing it for yourself. BTW,
> what is the name of this engineer at Eimac that gave you this false
> information? I'm thinking he gave you accurate information but you
> warped it to fit your pathetic understanding of electronic
> fundamentals.

His name was William Orr... you must be right... many of the 20 plus
full size SAI Handbooks he published seem to have that false information
included. I guess I've got to toss all his other published amplifier
conversion and construction articles out because they are also
false information.

> Quit avoiding the issue and post a link, Skippy. Lot's of Bill Orr's
> stuff is on the net, point to the direct quote where it backs up your
> claim.

18th Edition, pages 183 and 184 You've got crow feathers in your
mouth again.

> >Readers of the news group of course... yeah, you've proven twice
> >that you like grids tied to plates in rf amplifiers. That you threw
> >out a grounded grids G1, G2 and G3 circuit without understanding the
> >grid current issues of that design.
>
> And you still don't understand that all three grids are grounded in
> your favorite examples.

No, actually G1 has only a low impedance path to ground and it has
a different dc potential.

> >That you were clue less about
> >reverse screen current...
>
> You haven't given ANY explanation for why it is a factor with ANYTHING
> in this discussion!

The only factor about it was your over reaction to my jab and
pretty good indication that you were clue less about it when
you first saw the post.

>
> > that you called the KLV tank circuit coil
> >a shunt.
>
> That you can't even look up an old post and get the facts straight?
> LOL!

Will you settle for a choke which is still the wrong answer.
You couldn't even recognize a common LC circuit.

> >I feel fine frankie... I'd feel a lot better if you didn't go

Source record: 144078

Oh, I am not talking about CB folks having problems with hams; I am talking about hams having problems with CB folks. I think that sometimes folks forget about their roots, and somehow, when they get their ham ticket, they somehow become "better". Whether somebody gets their Amateur license or not doesn't make them "better"; they are still the same person, only with another certification. As far as myself, I haven't had too much time to get on any of the bands. For the past few years, I have been designing and building shortwave receivers, audio amplifiers, and other fun electronic things. My term at Motorola has ended, so I have been toying with the idea of starting an electronic kit company. Who knows, with the economy the way it is right now.

>
> Yeah? So?

If you knew so much about beam power tubes, you wouldn't have omitted
the contributions of the beam power tube electrode spacing and the beam
forming plates when you first did your cute little grid wire post
describing beam power tubes. Using your tactics, we must now assume
you didn't know about them because you didn't mention them at the
time of your post... and the beam forming plates are special to
beam power tubes which include sweep beam power tubes.

> >I find few if any good beam power tube circuits with the beam forming

> your favorite examples. ROTFLOL!

Actually got ahead of myself typing... but you wont believe that...
It should say I find few if any good beam power tube circuits with the
grids and beam forming plates grounded in AB2 circuits.

The corrected statement actually addresses two issues. The first is
that many or most Sweep tube circuits ground the grids and the beam
forming plates direct... bad news. I find few good sweep tube
circuits with the beam forming plates grounded that I think are
good designs. A reason I like to use the Palomar 300 (six tube
version) as a reference, it's one of the few good or respectable
AB2 circuit layouts.

> do you mean, Skippy?

Spacing between the electrodes... and for that matter the wire
spacing and alignment. They all matter...

>
> >> Once again, what about the electrode spacing? How is it different than
> >> a 'non-beam' pentode? How does it affect the operation of your

> >which modifies the performance of the the tube.
>
> And what is that difference?

As stated above, you would have to ask the tube designer.

If your asking what the performance would be... high power
sensitivity and high efficiency.

> Then, as you said, what other significant parts of a beam tube affect
> the operation of a triode-connected grounded-grid amp that are
> different than a pentode? Come on, Skippy, you made the claim, now
> back it up with some facts!

Physical...
In a beam power tube, electrode spacing and placement, the often
spiral wound shaded screen are big deals.

A non beam power pentode would be different in all the
above.

Many of those pesky sweep tubes you hate so bad share a
beam power tube kinship to the 4cx250b

skipp

I had a nice van come in needing an antenna mounted. Gutter mount antenna's aren't my "thang".

So I used a firestik mount that has a swivel on it. Found metal off of the front under the hood Mounted it. Positioned the stud so it was straight and put a Firestik 4 foot on it.

Now, I personally did not like how it looked. But the customer was tickled pink with it. The SWR set well, and he is a happy vanner.

Conversion van, vans in general always create problems but they are workable.

I am the first one to explain to a customer that aesthetics and antennas usually aren't in the same sentence.

Functioning antennas are my "thang". Have fun and God Bless.

ken,
in all due respect the truckers in the area do know how to read road signs. they are posted along the belt , southern, northern, sagtikos and cross island (missed a few i'm sure). once every other month there may be an incident but i doubt bangledesh has any worries about being compared to (though the 7-11 operators might like to hear that)...lan and wan were not even mentioned as the telecomms have other uses for the freqs...(btw, my line of work). one other point, do some research and you will find the trucking industry (only concerning the island) will be having serious competition if the rail line is run under lower ny harbor from nj to brooklyn... 73, jim

As a side note:

A faggot specifically refers to a bundle of sticks gathered together for burring a heretic at the stake. Also, my boss tells me when he first came to America he stepped off the plane in SF and immediately went to the concessions counter and asked "where can I get some fags around here?" The man very politely told him that while in America (and while in SF! hehe) it was best if he called them cigarettes.

Message-ID: <8zBB9.224771$r7.3843083@twister.tampabay.rr.com>
Source record: 144105

I just did some power output tests using a loaner palomar 225 which supposedly has a 200 pep watt output and my combo swr/power meter. The SWR was showing about 1.1 to 1.2. As shown in the subject line I did not get anywhere near the rated out BUT, WAIT, I want to ask questions because the lack of output might be some error on my part.

To do the test I connected a Cobra CB to one cigarette lighter adapter in my car and the amp to the cigarette lighter. I added a cigarette lighter adapter on the amp for this test and may have not paid attention to the gauge of wire I used.

Could the loaner amp show the same amount of power on med and high because of a lack of dc input power?

P.S. Note that I also used another CB in the test and the power output of 30, 50, 51 were about the same.

I just bought a Cobra 29 LTD Classic and was wondering about increasing the wattage...

If I'm not mistaken this unit puts out 4 watts, and has a range of 5 to 7 miles....

Can I increase to 20 watts, and what kind of range increase would it be????

I have a Radio Shack high power mag mount CB/10m 72" antenna..

In grounded-grid, ok. But as with any double-tuned amp you need to
watch for low-frequency parasitics.

> If you provoke it
>by removing both the input and output loads and swinging the input and
>output tuning, a well-constructed 8877 VHF amp will still not oscillate.

Of course it won't oscillate -- disconnect the output load and it's
going to flash over and destroy the tube! Disconnect the cathode and
the contact potential pulls the cathode positive until the tube cuts
off. The same thing happens when you disconnect the grid return on a
common-cathode amplifier.

>Why? Because the 8877 has a grid ring that makes a very direct,
>low-inductance connection to the actual grid inside (a sheet-metal cone

>which very effectively shields the input from the output).

The 8877 is indeed a very linear and stable tube (not so stable you
can do what is suggested above!). But it doesn't matter much in a
grounded-grid amp because it's a non-inverting amp and you don't have
any regenerative feedback to cause oscillation. A grounded-grid amp is
also less prone to parasitics for the same reason.

> If you ground
>the grid VHF-style, with finger-stock contacts directly on to the grid
>ring and fixed directly to the chassis, then the tube will not oscillate
>at VHF. This applies equally to an 8877 in an HF or a VHF amplifier.

I think you added that last line. Regardless, the tube will indeed
oscillate at VHF if fed with enough feedback in the proper phase. It
is impossible to prevent an amplifier from oscillating under those
conditions, even if it's built with the 8877. If you remember anything
about these posts, remember this: If it can amplify, it can oscillate.

>For glass tubes without a grid ring, such direct grid grounding is not
>possible, which is why we have to use Plan B - parasitic suppressors -
>to reduce gain at VHF.

Parasitic supressors are a good idea with any RF power amplifier, the
grounded-grid 8877 included. To not include even some basic supression
is risky at best. Saving the little bit of time and money needed for
the added protection might just cost you a very expensive tube.

>
>Nothing I can find on his web page is faulty... his grid screening
>text agrees with my Eimac Engineer Authored "SAI" Handbooks and
>my opinions.

Here's what Eimac says about grid screening:

http://www.cpii.com/eimac/sec2-2.htm

"The additional grid serves as a shield, or screen, between the input
circuit and the output circuits of the tetrode, and is called a
'screen grid.'"

Your misunderstanding of vacuum tube fundamentals has led you and your
mentor to believe the misguided notion that the screen grid is
responsible for eliminating neutralization in a grounded-grid amp. But
both of you have apparently abandoned the logic of realizing that if
this was true then no neutralization would be needed for ANY
common-cathode amplifier as well, which, of course, is not true.

Since you don't want to bother with the books, I suppose the internet
will have to do. Here's another link from Eimac to get you going in
the RIGHT direction with tube power amplifiers:

http://www.cpii.com/eimac/PDF/Section2.1.pdf

Note the typical applications of low mu and medium mu triodes. Also
notice that Eimac, a manufacturer of power tubes for longer than you
have been alive, recommends the use of high mu triodes for RF
amplifiers.

Also notice that Eimac DOESN'T make sweep tubes.

> His weab page goes through almost daily review by
>people on the cutting edge of current amplifier technology. He

Like I said, there is no evidence to support your claim that the tube
is immune from parasitics.

>> >Your simply wrong again Franklin... or frankie...
>>
>> All the data and facts support my comments and contradict your's. It
>> is YOU that is wrong again, Skippy.
>
>Da' facts are subject to revision,

There's your problem, Skippy. Your seem to revise your "facts" to suit
your purposes. For example, remember that callsign you emailed me?
Well, it is listed as IG, not IB as you claimed. And the license was
issued AFTER the 1997 consolidation, so it was NOT issued as IB and
later 'revised'. You are a liar, Skippy, plain and simple. And I have
proven that 'fact' many times in this conversation. Of course you will
probably 'revise' that fact in your reply...

I think nothing more needs to be said.

P.S: Keep checking my site. I plan on updating it soon, and will be
including new stuff as well as some other things that were on the old
site. Many of them are far more complicated than an amplifier, and
they might be a good test of your alleged electronics expertise.

That didn't help. The output of the amp
is dependant upon two things: input drive
and supply voltage. In your test the supply
voltage was less than ideal.

> Could the loaner amp show the same amount of power on med and high because
> of a lack of dc input power?

It was the same because the input power
was enough to drive the amp close to saturation
on medium.

> P.S. Note that I also used another CB in the test and the power output of
> 30, 50, 51 were about the same.

Your meter is probably reading something close
to the average power. The relationship between
average and peak power (the "225" front panel
designation is an idealized (tons of drive power
and higher than typical supply voltage) peak
figure) is 4:1. At 100 modulation 50 average watts
is equal to 200 peak watts.

In the old days (the 70's) the first transistorized
CB amps had front panel figures that reflected
their RMS output. The relationship between RMS
and peak is about 3:1. So, in the 70's your 225
would have been called a 75.

For more on how power and modulation are meaured
check out the AM Tutorial on my site. There's a link
below.

The AN/FRT-39B doesn't do FM, doesn't go above 28 MHz, and doesn't use
an 8877, so you must be talking about some other grounded-grid
broadcast transmitter. But you are claiming that you are getting 10 kW
FM from a grounded-grid 8877? Must have been because of your ability
to 'revise the facts'. LOL!!!

Yep, it is. I sold another Italian Starduster a few weeks ago that I had bought in the 80's. Sold one last year too, and it was years before that I sold one. It looks like Base Station season (winter) is here and may be increasing from what I have been hearing.

Anyone else notice any increase of sales of Base Stations or antennas?

Many broadcast transmitters do indeed run grounded grid. (see the links
furnished below)

"the grounded grid triode design offers inherently greater stability, better
performance and is less critical in operation than its tetrode counterparts
since it requires no neutralization or additional energy consuming power
supplies."

henry 2k-3 floor model

It was modified to increase power. I replaced rectifiers.Add new plate transformer. It can give you 1 Ampere with almost 4KV on anode on any band.(80-10M). Heavy duty amplifier.Pick up only in NY area.Can demonstrate on any band.People give me 20 db plus,when I use it.Wired for 220V. Comes with spare tube 3-500Z.I think of 800$. If interested - ak2p@qsl.net

1596. Cobra 142 GTL Modulation quality problem

Newsgroup: rec.radio.cb
Date: 2002-11-17 05:38:22 UTC
From: Anonymous <Nobody>
Message-ID: <3dd67e51$1_3@anonymous>
Source record: 144132

I'm working on a friends Cobra 142 GTL. The issue I'm attempting to solve is muddy, bassy modulation. It sounds like all the audio frequencies from about 750-1k up are filtered out of the transmit modulation. Other then this the radio works fine. Excellent RF carrier etc. I changed the AN612 audio chip hoping that was it but no improvement. I also changed out the 47uf cap between pin 9 and 10 on TA7222AP per another techs suggestion with no improvement. The radio was talking fine one day and just started sounding like this. Any suggestions on solving this would be great.

Thanks ....

Dave,
Actually, I do fix old Fords. Right now I'm working
on a '51 F-1. Got it almost stripped down to paint it
and put in a new motor (the old motor lasted for over
50 years and lord knows how many miles). Got rid of the
vacuum wippers, putting on power brakes, then a new bed.
I've also done a '52 Chevy, and a '66 Coupe de Ville,
wish I had had the '66 back (wish I had the '52 also!),
but I'm a sucker for large denomination bills waved
under my nose.
'Doc

PS - Friends don't let friends drive Chevys. Are you a
Chevy driver?

The question was how many I have seen. Like I said, I haven't seen any
grounded-grid BC transmitters, save the exceptions I mentioned. But I
DIDN'T say they don't exist.

Now perhaps you can explain why Skippy thinks an AB1 grounded-grid
doesn't require input signal power, or how he can get 10 kW FM from a
grounded-grid 8877?

>"the grounded grid triode design offers inherently greater stability, better
>performance and is less critical in operation than its tetrode counterparts
>since it requires no neutralization or additional energy consuming power
>supplies."

They do require less maintenance, but I don't agree with the claim of
better performance. On the average, the noise is a bit worse, they run
'hotter' and need replacing more often, and the overall power
requirement isn't any lower for the same output power.

Source record: 144143
Cross-posted to: rec.radio.cb,rec.radio.swap

Here we go again --
First it was a bunch of whiners crying over a frequency chart, now it's XTALS (That's "crystals" for skeptical , pessimistic posters - namely Cheesecutter)
Quit yo cryin' and go somewhere else and cry!

You don't run Lou's business for him.

And, furthermore, Lou's post is not SPAM!!
It is fully relative to this newsgroup!

How many other newsgroups do you "attack" with your useless bickering!

We Know What Year It Is -- How 'bout You!
Where Are You , This Year?
What year do YOU choose to live in?
(RIGHT - Only YOU choose! No one else is gonna choose for YOU!)

I'm going to download that chart so I can check my radios.
So, why don't you stop me?
You have no RIGHT to stop me nor any of us CBers and Radio Operators from getting information that I need to maintain the operation of my radio!
(You are just "cruising for a bruising!")

How do you think it would be if all of the people in this world went around and do like you are doing now? HUH?!!
(don't wait for someone else to give you the answers -- YOU figure it out!!)

Your useless attempts to divert the topic of CB in 2002 is Futile!!
Let It Go!!
If this newsgroup is such a burden for you then take it off and get on with living and Accept It!

You are willfully destroying the interests of other CBers and Radio Operators who might need that chart so they can get their radios working again.

You have no business "attempting to change other people" nor "preach" to them about what year it is!

Start your own newsgroup if you wanna "cry" about others providing "very useful information!"

It seems that this society is plagued with hearing others reciting that meaningless "It's Useless Information" crap!

This society of human beings has become SO negative(-), that negative(-) sayings are all they that know and proudly recite without shame!

They despise positive(+) sayings!

If you ever studied, read books at all, the flow of current is from (-) to (+)!!

SO, Change The (-) Attitude!!!
Be (+)

It is Useless Information because IT's not being USED yet or not at all!

It is Useful Information when It IS USED!

(There's no such thing as "hasn't been"!)

This Is 240 - Robert, Out.

MMan this is tempting. Stock radio. 4 watt input - 3 watt swing. 7 watt output. Advertising on the box.

After you have it tuned if not hacked. Average 4.5 to 7 watt dk (input) with an average output of 14 to 16 watts (swing). Now this all depends on your techs meter and honor.

Sometime, but not often you will see a cobra doing 20 watts on the "swang".

7 miles? Are you really getting 7 miles. With your stock radio. Not even an option here in the mountains. Or in the big city. OOPS I guess I injected my opinion here. But that is what our drivers tell us.

Good luck. Shoot skip the challenging way. Find a carrier and see how far you can go with a clean signal instead of a busted out overmodulated radio that sounds bad up close. Oh man, another one of my opinions.

Opinions expressed in my posts do not necessarily represent management. As a matter of fact, management would prefer I not post anything. Told me they would fire me.
"Keith" <Fk-U-2@webtv.net> wrote in message
news:26996-3DD6E669-18@storefull-2172.public.lawson.webtv.net...
I just bought a Cobra 29 LTD Classic and was wondering about increasing
the wattage...

If I'm not mistaken this unit puts out 4 watts, and has a range of 5 to
7 miles....

Can I increase to 20 watts, and what kind of range increase would it
be????

I have a Radio Shack high power mag mount CB/10m 72" antenna..

My initial question would be Why would you abuse someone else's amp like
that. Secondly, why are you doing test?
Or are you a student and want to burn up your car, dad's car?
Not sure. Not too smart if you understand amperage draw. Current. Hot.
Melt. Starve poor amp. Take out transistors. Tear up Loaner amp. Back to
square one.

Motherly aint I?

Sure the truckers in the area's know better but when you listen to 19 most
of the morning truck runs are by guys with southern accents.(of course
southerners bitch more about NYC then the local guys do).
On this past Friday we had one on the FDR and one on the Jackie
Robinson...all before 8 am!
And on the BQE there is a sign telling trucks to exit at atlantic if over
12'2"...Without CB many would and that would be a nightmare. The sign is
totally bogus. The standard 13'6" truck needs to stay in the middle lane
past the Brooklyn bridge. The bogus sign does contribute to the charm of
driving in NYC:)
Sincerely
Ken

The key is to have a valid argument then insert something outragous like"Ham is mearly a toy" that is semi-valid(hobby=expensive toy) and semi-insulting. Timing is important also. Such posts need to occur when the "Ban CB" nuts are actively posting.
Ham is a great hobby and does serve the community in times of disaster. CB is both a tool and has been a jumping off point for future Hams. And can be an enjoyable hobby on it's own.
Imagine gun owners started with the rifle crowd yelling "ban the shotgun" and the shotgun crowd doing the same. They would look silly. Trolls work best in silly waters:)

Hi;
I am looking for a manual and schemetic, or copies of, for a Korean(?)
built Jopix Delos SSB-AM-FM, 6 - 9 Mhz 50 watt mobile transceiver.
A web search finds their 10/11 meter models popular worldwide, but I need
the info on this model. Will pay for copies or buy a manual.
Also would appreciate any leads on such or to people with experience with
these rigs.
Please respond to k7rzf@attbi.com direct and I will see before a newsgroup
post.

Thanks
John - K7RZF
Portland, OR

Maybe I is too American or too Hi-Tech--I don't want to sell JUNK or have
others BUY any junk. Unless the antenna is FREE (same price as a 510
without da magnet), then it ain't worth a Ford nickel, cause it is Chinese
made JUNK that will rust moe dan yo '66 has so far! (in 1/100th of da time)!
Dave!!

Forget the "Swang" nonsence ! The CB just can do 5-6 watts AM dead key and a watt or so on an AM meter when whistling into it. QUIT using SSB meters when yo whistle, and yo wont git np 15 or mo watts ! You modulation kit installers ARE the BUTCHER SAHOIPS of da CB world!!!!
DDave!!!!!!!!!!!!!!!!!!!!!!!!!!! (I can't see what I typed, so I can't correct it! I'd like to correct mod. kit installers WITH A CANE ! CAIN THEM !!!

"DLHicks" <dlynnhicks@mchsi.com> wrote in message
news:yzPB9.30188$__1.15934@rwcrnsc51.ops.asp.att.net...
MMan this is tempting. Stock radio. 4 watt input - 3 watt swing. 7 watt output. Advertising on the box.

After you have it tuned if not hacked. Average 4.5 to 7 watt dk (input) with an average output of 14 to 16 watts (swing). Now this all depends on your techs meter and honor.

Sometime, but not often you will see a cobra doing 20 watts on the "swang".

7 miles? Are you really getting 7 miles. With your stock radio. Not even an option here in the mountains. Or in the big city. OOPS I guess I injected my opinion here. But that is what our drivers tell us.

Good luck. Shoot skip the challenging way. Find a carrier and see how far you can go with a clean signal instead of a busted out overmodulated radio that sounds bad up close. Oh man, another one of my opinions.

Opinions expressed in my posts do not necessarily represent management. As a matter of fact, management would prefer I not post anything. Told me they would fire me.
"Keith" <Fk-U-2@webtv.net> wrote in message

I just bought a Cobra 29 LTD Classic and was wondering about increasing
the wattage...

If I'm not mistaken this unit puts out 4 watts, and has a range of 5 to
7 miles....

Can I increase to 20 watts, and what kind of range increase would it
be????

I have a Radio Shack high power mag mount CB/10m 72" antenna..

Channel 19 (27.185 for you Hambobos & SW listeners) IS where the Truckers, steering wheel holders & spacers are. Us high speed 4 wheelers are there too. 19 IS the eyes of the road, except on da left coast, where they use 17 from north to south, because like everything else the liberals do, they PERVERT it ! Could comeone that KNOWS in Californy tell me WHY did they come up with North & south roads or ALL roads in Cal. use 17? Is it because of the conjestion on 19 in LA (and I don't mean Lower Alabama) on 19 in da 70's warranted da change? MORE comments below each point below for MORE laughs!
Dave!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

In looking at the schematic for the amplifier... I see it has no bias for
AM. Why?
I also think that the bias source, through a 20 Ohm resistor is not capable
of maintaining forward bias at higher drive levels.
I also see one more thing... You show different component values for the use
of MRF455 and MRF421 transistors... but yet the transformer ratios appear to
be the same for both. I hope this is an oversight... as you know the
impedances of those two devices is considerably different.

WHAT kind of DRUGS are you on, a NON-CB'er, to make such a statement as what
I cut out below? Is it your JOB on this NG to BASH CB on every front
possible? IF you can't promote CB like a lot of us do, and realize the GOOD
aspects of it, GET OFF the CB NG, then go BUY a CB radio so you can have
standing here, and maybe we'll let you back on da CB NewsGroup!
CB is VERY VITAL to trucking. In this Govt. controlled/Fed. Reserve caused
DEPRESSION we are in, do you think truck drivers can afford the high priced
VHF radios as compared to CB's? NO they can't!
Dave!!!

1652. Re: Palomar 225 amp, lo = 30 watts out, med = 50, and high = 51.

Newsgroup: rec.radio.cb
Date: 2002-11-17 21:40:52 UTC
From: Tom <nospam@tampabay.rr.com>
Message-ID: <E1UB9.315277$S8.6222634@twister.tampabay.rr.com>
Source record: 144238

I reworked the input power for the amp directly off of the battery using the wiring supplied with the amp. There was very little change in the output. I did determine the output of the CB itself is only 2 watts using the PEP setting on my power meter.

Note that the other readings were taken as PEP as well.

The question now becomes if the Cobra is not putting out sufficient power would these power readings from the amp make sense. In other words does a power reading shown in the subject line make sense for a Palomar 225 and a 2 watt input?

Did you read Bill E.'s AM power FAQ yet? The idea is to have a four to one
dead key to maximum modulation ratio. If the maximum PEP out of the amp is
200 watts, the dead key should be 50 watts maximum.

Until you get into it. Just be careful. There are a lot of shops out there that are interested in taking your money. But there are some honest shops out there. You got my point. I always tell my new cb customers to run it like it is until you are certain its what you want to do. The key is the antenna.

I did mention the "swang" word because I would figure that about oh mmmm what would you say DAVE. Over 80% of the users out there are looking for maximum "swang".

Dave simply change the color of your font and you will be able to see what you typed. To correct your spelling simply highlight your text you cannot see and then you can see it to correct it. Your welcome.

Have a wonderful day, both of you. Remember if you think you know it all, and don't listen to others with discernment, then you have stopped experiencing life as it should be experienced. Learning is growing. If you stop growing then you are too old and just might not make it out of bed tomorrow. :)

God Bless.

Fixed a TV antenna, or put up a Rotor. I did it recently and MAN did I feel how OLD I really am! I remember doing these things 20 years ago or so, but MAN did it take a lot out of me for a 1/2 day job! And the Pain, OH the pain (Dr. Smith died recently).

Any rachet Chimney mounts made anymore? I fixed an old one. I remember in the 80's when they quit making them. Just think of this scarry thought: No need to put up any more CB base or Ham antennas, TV, FM or anything on a tower or chimney. Everything you did, do, & say, was comming over yo grey dish satelite today! And to think I remember about hearing about "Antenna raising parties" where they put up moonraker 4's on a tower, or something else! WHO will teach the young whipper snappers like Dug YoDare how do do this kind of work? Who taught me? I guess it was God Given, in my blood! Anyone else have similar situations or rememberances? ! ! ! ! ! !

Then why does ARES and RACES have permanent desks at most EOC's from the
Federal
level down to local? Your REACT folks have trouble getting in many doors.
And the Fed cares
enough to enact exemptions to local restrictions (antennas) for hams that
won't apply to CBers.

Remember, Dave, these paragraphs were posted in response to the implied
meaning from Kenneth
that Amateur Radio is "only" a hobby. It IS a hobby, but it is MUCH more
than that, and is why CB occupies 40 channels (except for that which outlaws
steal for themselves), and Amateur is allotted WAY more than that.

Subject: Kentucky hero called truckers' prayer meeting to catch snipers

SPECIAL TO WORLD TRIBUNE.COM
Thursday, October 31, 2002

One week before a Kentucky truck driver spotted a blue 1990 Chevrolet Caprice with New Jersey tags at an interstate rest stop, he had used his CB radio to organize an impromptu gathering of truck drivers to pray for an end to the sniper crisis.When Ron Lantz, 61, pulled his 18-wheeler into an interstate rest stop in rural Myersville, Md., at 1:54 a.m. on Oct. 24, he said something just clicked. Spotting the car that had been used by the Washington-area sniper suspects, he recalled the police news conference he had just heard on the radio. He called 911 and within hours had become a hometown hero in Ludlow, Ky., where he has lived for 40 years and attends the Covington Central Nazarene Church."He was driving down I-70 and got on his CB radio," Rev. Larry Dillon told World Tribune.com. "He told our congregation he was overwhelmed by the response." Lantz organized the truckers' prayer meeting on Oct. 16, just one week before the sniper suspects' arrest. Lantz said some 50 truckers gathered at the pre-arranged stop near Baltimore on Oct. 16 and prayed for America, for an end to "evil in our country" and for the arrest of the snipers who had been terrorizing the Washington, D.C. metropolitan area.Lantz said he heard a description of the car while listening to the "Truckin' Bozo" radio show, which originates from WLW-AM in Cincinnati. Host Dale Summers told listeners about the car police were searching for in the Washington,D.C. metropolitan area. "I seen one guy sleeping in the car and one guy standing beside the car when I pulled in," Lantz said Thursday afternoon after returning to Ludlow, Ky., his hometown of 4,400 across the Ohio River from Cincinnati. Lantz said he stepped out of his truck to use the men's room, but climbed back in to call 911 on his cellphone. He and another trucker used their rigs to block the exit of the rest stop, he said. "Not even 15 minutes later, the FBI , ATF, everybody showed up," he said. John Allen Muhammad, 41, and John Lee Malvo, 17, were arrested a short time later, and Lantz continued on his way. When he arrived at his home on Poplar in Ludlow, he was greeted by family, friends, neighbors and TV cameras. Early Friday morning, he returned to WLWT for appearances on NBC's "Today" show and MSNBC, followed by interviews with other local and national TV outlets. Lantz, a trucker for 36 years, drives for Indianapolis-based Thompson Trucking, a contractor for Bass Trucking in

Flemington, N.J. He stops regularly at the rest stop during his twice-a-week drives hauling parts for storm doors and windows between Delaware and Ohio. According to friends from the Covington Central Church of the Nazarene in Covington, KY, Lancz is a model church member. Even though he is an over-the-road truck driver, Lancz is a faithful attendee, bringing his five-year old granddaughter to church every Sunday that he is not on the road. Lancz is the leader of the local men's fellowship group.Lantz's story touched off a frenzy at the Kentucky home he! shares with his wife and adult daughter and granddaughter. Reporters began showing up on the Lantzes' doorstep and ringing their telephone for interviews. "It's unbelievable to me," Lantz's wife, Ruth, said. "I can't comprehend. We live a very quiet life here. We have an unlisted number. Now everybody has it. Everybody in the country is calling." "We're just ordinary people here, just living in an ordinary city," Lantz's sister Ronda Zwick said. "This is very different for us." Neighbor Tony Ledonne said he knows Ron is "one of the good guys," but never imagined he'd have a hand in solving an alleged murder spree. "It just goes to show how small of a world it is," Ledonne said. You have a sniper shooting in D.C., and a local neighbor in Ludlow, Ky. helped capture him."

FOR SALE:

Mattco 745 Frequency Counter

Works with any radio to measure and show your
operating frequency. Simply connects in line with your
antenna with a PL-259 jumper.

Has controls for ON-OFF, SENSITIVITY and MHz-KHz.

The digital readout will show, for example 27.185
in the MHz position or down two digits further
(if you want) in the kHz position.

Works at all power levels from 2 watts and up.

Requires 12V DC to operate. Fully tested and guaranteed.

Will sell for $125.00 plus $5.00 conus shipping

Have a Realistic Marine radio and when I cut it on you hear sound but it goes away....it's like it's squelching itself out(It is NOT a loose connection on the mic,I've tried the wiggle thing and it's not loose)....squelch is fully to the off position but still no sound...every now and then you hear it for a second or two like you cut the squelch back,yet it's fully back ??? Any ideas on this ?? oh yea and also there is no TX , I haven't tried another mic yet ???? any help or suggestions appreciated at 100%

I'd like to be able to reach into my bag of tricks and give you the one component solution, but this specific problem has never happened to me.

I've got to ask the simple question, did you try a different mike? I've seen this type of problem happen due to mike related problems, more so than radio problems.

If you've ruled out the mike, then the best way to find the problem is by using a variable frequency audio generator, and sweeping the audio stages, looking with a scope at each point, until you find the stage that's killing your high end frequencies.

Is this problem on receive as well? If not, you can pretty much eliminate all common audio components (including the audio amp chip, the TA7222) that are shared on both receive and transmit. That leaves the mike preamp circuits, and the regulator/modulator. Is it on SSB and AM? Another path to go down. The more you can eliminate, the easier it will be to find.

Sounds like the PLL unlocking. Do a reset.......or try this: With the radio off, press the mic(PTT) and turn it on at the same time. That "occasionally" will the lock the PLL. Worth a try.

> Hambos get from their Ham stores?

That depends.

Are you talking about 100 watts dead key, or 100 watts peak? If you are talking about 100 watts dead key then you are right, there are no out-of-box ham radios that can support 100 watts dead key and still have any headroom left over for modulation. That INCLUDES the FT 101's. The FT 101 could support a dead key to about 30 - 35 watts before it started to compress, depending on how "fresh" your tubes were.

If you are talking about 100 watts peak, then just about any ham rig made, that has the AM mode included, can be made to run on 11 meters, with a 25 watt carrier and 100 watts peak modulation. Most don't sound all that impressive on AM, some do ok. But they can do it.

Passing it on:

Dear Friends,

We a proud to announce the winner of the First World Wide Field Day Contest 2002 - we do hope you will foregive us the litle delay:-)
The Winner Team is

3FAT/FD001
Members of the team was: 3FAT010 op.Eduardo and 3VAL001 op. Val They made 120 QSO's into 38 different DXCC's and they made contact to 40 other FD-Teams during the 24 hours
The result gave the team 28.400 Points

On The 2. Place

14RC/FD001
Members of the team was:14RC092 op. Pat and 14RC362 op. Pierre The made 140 QSO's into 32 different DXCC's and they made contact to 31 other FD-teams during the 24 hours
The result gave them 18.910 Points

On the 3. Place

19AT/FD001 (on the air they had to use 19AT684/FD001 as their callsign)
Members of the team was: 19AT684 op. Bart - 19AT448 op. Bob - 19AT226 op.fred
They made 119 QSO's into 30 different DXCC's and they made contact to 31 other FD-teams during the 24 hours
The result gave them 17.949 Points

You can see a list of result from all the teams on www.wwfd.dk click on past contests

We ofcourse give our big congratiulations to the ALL the teams that was a part in the first World Wide Field Day Contest on 11-meter and we hope to see and hear all the teams again in 2003 along with many new teams

WWFD.DK will send all the trophys direct to the winners in february/march 2003

Best regards
Tom
Secretary

Sparky
FLCD
Sparky@Cet.Com
My guess is this is Twistedhed forging.
-Aaron-
I agree, Aaron. Twithed did it.
Maybe, since he tried to forge me with N7VCF@cotse.com.

Frank has allowed his word, much to his chagrin, to be his downfall. He forgets what he claims and in many cases has self-contradicted himself. His last snafu cocerning his locale was when he claimed a "local" was busted for radio interference, then when he was asked to show something other than his claim, he posted a link to an incident clear across the state near Seattle..when the location was pointed out to Frank as not being "local" to him, he immediately changed the subject matter and attacked with the usual name calling and his personal fondness...accused me of "nitpicking" and went on a rant how his "post" was proof of his claim and how I was just "looking" for a way out because I was "proved wrong"...ahahahahah! Don't know why anyone would really care where Frank lived anyway..he can usually be found online at all times......there are even a few posts where he was using the call in his sig, but he only did it a few times...for some reason, paranoia of identity ranks extremely high with Frank. Take into consideration all his posts concerning his half efforts at finding info on internet strangers, and his obsession with identity becomes crystal clear......another whack job at best, but he's relatively harmless.

The least technical approach to fixing it would be to try cleaning
the squelch and volume controls with some tuner wash. These
radios are known for control problem especially if used in saltwater.
I have seen controls eaten up so bad they won't even clean.
Second, check for bad solder joints. If this doesn't fix you up, I would
strongly consider throwing it in the trash can and picking up one
of ther new ones available on Ebay for around $100. You'll end up
better off in the long run. Just my .02 cents.

Finger check, that should be Collins 32V-3.

You believe what you want to belive Frankie...

The rest of us know the truth. The 10 ohm resistors help for various reasons... a modest list of I posted on this news group less than 2 weeks back.

Life goes on...

> >> operation is posted all over these threads!

If you say grounded grid AB2, we are talking grounded grid AB2. If you
jump over to common cathode AB2, then tell us your doing so. This
thread,
most all the text I have on sonic about Sweep tubes has been related to
grounded grid AB2 amplifiers. Just remember to use your news group
turn signal and we won't have any problems franklin... that's all I
ask...

> >The issue has been... trying to keep you from jumping back and forth

If you find an error on the web pages, point it out and one of us will
fix it asap. Simple enough...

> >> >Once more for the road... we've been talking sweep tubes in AB2

yeah, I'm getting all confused from reading your rants... In the real
world, I have seen few if any AB2 common cathode Sweep Tube Amplifiers
by percentage... I had not considered your common cathode talk to
include them... although there is no reason why we couldn't. We I
write classic sweep tube amplifiers... I am not referring to common
cathode circuits unless otherwise noted. I feel it's not worth clouding
the topic up with a sweep tube layout that is less than 20% of the
many Sweep Tube RF Amplifier sold through the years.

>> >Just as a side bar comment, not all common cathode amps require

>
> I'll take that as a non-response.

You compared the Cgp of a sweep tube to an rf designed power tube.
That's
all fine and dandy, but the Cgp of the Sweep tube in a grounded grid
circuit is easily low enough to allow the tube to function well.

>
> >> >Unless you put on the the turn signal... we are talking grounded

>
> Sure, just as soon as you demonstrate an understanding of the
> differences between AB1, AB2, grounded-grid, and common (grounded)

> cathode amplifiers. So far you haven't been able to do that.

General rules:
AB1, no grid current. Fractional wattage drive power requirements. So
low,
most rf people as a general rule say that no drive power is consumed by
the tube. Most all AB1 rf power amplifiers circuits are common cathode
by convention. High stage gain comes with/at a price, as in technical
requirements and the application of a tetrode/pentode.

AB2, indicates grid current flow, significant drive power is required
to drive a cathode driven or common cathode circuit layout. Triodes,
tetrodes and pentodes live in AB2 circuits.

Some grounded grid or "cathode driven" layouts have many benefits
allow Sweep tubes to operate well. Quartets and larger amount sweep
tube layouts make nice moderate power desktop amplifiers.

One should not apply certain geometry type tubes to some specific
types of grounded grid circuits, there are issues with excessive
grid current and drive division which require special attention. In
the generic world, we might say that specific high mu tubes don't
operate in certain grounded grid "triode mode" type circuits...
i.e. they are subject to premature failure.

As with all things, there is always a work around...

> >> > By the way, did I tell you I have a two tube common

> Well, eight feet tall is over six feet tall!" Sounds like you, Skippy.

10 dB is the general rule breakpoint where I consider building certain
amplifiers. Six feet tall is still good enough .... so is 10 dB.

> >It's actually about +13 dB gain where I operate it,

There is no need to associate it with any Sweep Tube Grounded Grid
circuit I've ever mentioned... nor have I ever mentioned it related
to said. I have talked about it with tubes like the 4cx1500 and
similar types... as seen on the sonic server. No, it wasn't a joke,
it was a jab for you to relax... at that point in the thread, you
appeared to be popping a gasket. It was an easy way to say "take
a chill pill" frankie. Despite the bitter pill you appear to be,
it's actually fun to joust back and forth. Just hang up that imts
phone and drive.

Eimac Engineer William Orr, 18th Ed, SAI Handbook, pages 183 and
184 are some good places to find your crow dinner.

> >> And that STILL doesn't explain what you were allegedly referring to

> sweep tube doesn't work like a triode! Now THAT's a GAS!!!

See the reference supplied above... SAI Handbook, 18th Edition...
actually, he wrote over 20 different well known Editions, I'm sure
it's in others if you look.

> >Now your running out of steam again... plus the words boring
> >come to mind Frankie. Stop boring us trying to make something

Truth hurts... OK tell ya' what I'm going ta do... how about you
relax and lose the off topic poop, and I'll drop the no fly zone
and we talk specific technical issues...? good enough... see,
frank... I'm reasonable.

>

>
> Do they use the term, "tube geometry"? If so, in what document?

Yeah, its mentioned in the same text book above. Just in the part
about operating certain types of tubes in grounded grid triode mode
being bad news for the home team. There's also a specialized grounded
grid circuit shown that will allow them to work, but it's a very
interesting hybrid.

> >If you can grasp the difference, see my description of the three

> you keep saying that it's such a bad thing to do?

Yes... I'm not a big fan of the actual Dentron Circuit... it should
be improved upon. I do not consider it a successful amp... just one
in mass production that can be used as a parts building block for
a fun amplifier project. Remember, the Dentron had special D-50
type tubes shipped as new.

Yeah, but as I mentioned, there is always a work around. I've seen
4cx250b's and similar in grounded grid operation. Works well if you
wanted to do it right.

> > and many Beam Power "sweep tubes".
>
> You said that just to get my goat, right?

Did it work..?

Nope, it was one of your earlier posts which I believe also contained
the ungrounding the cathode rant.

One other thing... I do not consider the degeneration provided by the
10 ohm series cathode resistors as "feedback". I just use the more
accurate "degeneration".

As I mentioned before... I'm not the source of the cathode resistor
dance. I lifted it from a guy named Art Collins who used it in at
least one of his "still" very popular grounded grid HF amplifiers.

> If you didn't read that then you need to do as I have suggested many

Well plot a load line, add a resistor in series with the cathode and
then report back what it does for both the AC and DC load lines.
Your results should be the same... more linearity.

> > but the resistors function by providing

> 'swamping' of the input, because they are in series with the cathode
> and INCREASE the impedance at the input of the tube.

I don't use feedback... I use just degeneration. Yeah, the real
world result is slightly higher drive requirements. Easily handled
by most amateur transceivers.

I don't like to call the series 10 ohm cathode resistors, swamp
resistors. You need to un-dock from the feedback space module
and come over to the degeneration space station. The resultant
impedance increase is not a bad thang' it's a good thang' in
this example.

> Jeez, Skippy, will you ever learn?

About hot biscuits and merle haggard... already did.

Not without my passing the collection plate first... The text is
subject to correction when errors are pointed out. You are the only
one who has claimed foul above the hundreds of skilled amplifier people
who have reviewed the text.

I and others agree with the result and the 10 ohm resistor suggestion
stays put... If you don't like it, type in your opinions and I'll
put them up on the sonic server as received. Anyone who does the
proper homework to understand what the real story is wins. Hey
frankie, we got a "win win" going here.

Plot the load line without the resistor, then add it in. Both the
AC and DC load lines will be different. I might explain what your
asking above, but I won't at this time.

> >> > You did not

Depends on the impedance of the "bypass". "All that is bypassed
is not grounded".

All that glitters is gold... only shooting stars can break the mold.

I don't understand. There are **three** 220 MHz repeaters in Rochester, NY, alone. One connects to the 10 meter port and other ports. Who is spreading a rumor that 220 is unused? In sparsely populated areas, perhaps (but you can likely a lot of unused frequencies in North Dakota and other sparsely populated areas). Sure, if you tune in at 3:00 AM, they are likely not to be used (along with all the other repeaters - then again, I've had some interesting QSOs on the repeaters at 3:00 AM).

73 from Rochester, NY

> clipping.

Depends on how you qualify clipping. All the clipping claims can
go out the window when your talking a DSP type of circuit... but for the
original analog world. Some people claim the "hard limiting" circuit
does not clip in the traditional sense. Many of my broadcast station
limiters do the agc and "hard limiting" operation. Symetrix is
one such circuit I can reference. Doesn't matter, if you've been
around broadcast, you know the station/program manager is gonna
crank everything up to "annoy mode plus" anyway.

It's my opinion that many Station/Program Managers and
Contest/Amplifier Operators come from the same plastic injection
mold.

> >Without proper power control, one should not rely on the mic gain to
> >ensure the amp is not over driven.

Sure I do, but if you understood how some of the newer radios work,
you'd know the power control does its job pretty well. You can
cranks the heck out of the mic gain, ride it to radio ALC purgatory
and the radio power does not go above the set value. Very handy
amp over drive assurance.

> > Indication of the amplifier to

Not in a lot of grounded grid HF amplifiers. Aside from a rather
wacky Alpha bias circuit, it's the only other example I can remember
seeing in an amateur circuit.

Two types of ALC found in typical Amateur Radio Stations... on internal
to the radio, the other a wired loop from the amplifier back to the
radio. Neither should be trusted to a large extent, the latter not
at all in my opinion.

> >It should not be relied upon; especially if there is a valid power

Manufacturers make mistakes as do you and I. Some are in hardware
form, others found in the printed manual.

> >> >The power control knob of a modern amateur radio should not accused

Not on my radio...

"Control" implies the ability to limit power. The mic gain does
not actually function to limit power.

> >> ..."poop gate"?
> >
> >Control your max drive.. ALC and its poop generation are avoided. If

> Swan 350.

Dated material... there is no assurance that a drive "limit" is not
exceeded. There is no limit control with the mic gain.

Been there, done that coffee mug tee shirt... By the way, some of
that ARRL text comes from Rich, the guy who's web page said blows
some errors by... The other stuff I like to quote comes from
William Orr who wrote 20 something plus Handbooks... you also don't
seem to like what he has to say even though he was an Eimac Engineer
(now sk).

So I give them credit for hundreds of articles and text in 25
plus Handbooks published through the recent years which agree
with other books I have read in depth.

We're still waiting for you to tell us what if any books with
RF Amplifier information/projects you reference..?

> >Right effect, one of the reasons.
>
> Your 'reason' is based on flawed information. Like I said, try READING
> those manuals instead of just collecting them so you can show them off
> to people to give them the false impression that you actually know
> something when you don't.

And the name of the book your referencing rf amplifier text from..?

> >> >> >Many Amateurs using ALC are clueless about the actual
> >> >> > circuit operation.
> >> >>
> >> >> Yourself included.

> >But you say they work... I say they do not work well enough to be
> >relied upon... swan or no swan radio.
>
> I said that they work within their limitations. You misquoted me
> AGAIN.

Their limitations include a time constant.

> >> >> >Before the ALC acts (time constant)... unwanted poop is piped out the
> >> >> >coax connector to the antenna.

> >> >>
> >> >> See above.

Slow ALC operation results in amplifier over drive conditions unless
you have a true power control. Many modern day amateur radios have
power control.

> >When your over driving

>
> What does that have to do with your confusion between 'limiting' and
> 'compression'? And didn't you say you wanted to drop this topic?

When you have an rf amplifier in compression, its not as linear
as when it was not in compression.

> >The two available speech processors are not power controls, nor
> >do they interact with the power control function of the radio.
>
> Now where did I say that the speech processors are power controls? I
> didn't. You misquoted me AGAIN.

Never said you did...

> You know what, Skippy? This whole conversation has been nothing but
> you misquoting my posts, changing the subject when things get too
> complicated, tossing out stupid catch phrases when you have no idea of
> what you are talking about, etc, etc, etc. Is this your normal
> behavior, or did you go to a special school for the technically
> handicapped?

Your starting to read like you haven't even got much rf amplifier
experience under your large belt frankie. Now your getting mad
because your lack of experience is really starting to show.

> >Some of us use the power control knob on our transceivers. Amateur
> >HF Radios without true power control knobs require closer attention
> >to prevent over driving external amplifiers.
>
> I'm not going to repeat myself any further just because you won't
> learn the fundamentals of SSB modulation.

The mic gain is not a power limit control frankie...

> >I'm telling you that I can set the power control on my radio to
> >keep the radio from over driving the amplifier. I don't bother
> >with the amplifier ALC wiring as its not needed.
>
> If you can keep the peaks from clipping without an ALC circuit then
> you probably don't need one. But most people do not monitor their
> signal on a sampling o-scope, either.

On a modern day transceiver, one can simply dial up the max power
level and relax. Mic Gain, ALC and Speech Processing pretty much
only hose up the audio quality from that that first power control
adjustment. The amplifier is not over driven... clean rf signal,
audio as you like should be what comes out the pipe.

> >If your using your ALC with a radio that can over drive the connected
> >amplifier, you are almost always going to over drive the amp in
> >"normal transmissions".
>
> Not necessarily, and that's a very broad statement.

Based on the almost majority of examples, often demonstrated
on the Amateur Bands... it's right on.

>
> >Yeah, Radio Amplifier connected ALC has its limitations...
> >its simply not fast enough. I'm not ignoring that fact.

>
> You are ignoring the operating principles of the circuit.
> And you are still ignoring my earlier posts.

I'm going to miss some of them because of the shear volume of
text you posted. I'll answer back what I can get to as time
allows.

It's a lot of fun watching you face the real world. I hope
your smiling franklin. Now go shave.

chow for now

You'll probably have to make your own...
I made a similar setup up there once from a mobile (base loaded) antenna and four radials made of aluminum grounding wire tacked to the ceiling joists. The match was pulled in via antenna tuner, and it worked like a million bucks...

No - you'll fry the radio. Usually, doubling the voltage to a given load will quadruple the power. The radio itself is designed for 12 volts and most of the components won't handle too much more. Amps are another thing - they don't have a lot of low power stuff (such as a PLL or receiving components) and sometime guys may feed more voltage to them (if they know what they are doing). I won't get into legalities, I'm talking actuality - don't try feeding excessive voltage to your cb radio. They say 12 volts but are designed for 13.7 (normal with the engine running and the charging system working normally) and will usually handle 16 (note the word 'usually' - I wouldn't try it). Beyond that, the caps may well spread aluminum foil around inside the radio, transistors will short, resistors will smoke and you will be one unhappy camper. BTW, I've seen a UHF radio that suffered the consequences when a voltage regulator in a vehicle died and subjected the system to overvoltage - shorted cap, burned resistors, and one shorted final. Problem is, although it was fixable, one couldn't guarantee that it would continue to work as the whole thing was stressed. We wouldn't fix it.

For electronic components, I highly recommend All Electronics. They're much cheaper than Ripoff Shack, but they charge a flat rate of $6.00. So you'd need to wait until you need a bunch of stuff to make the shipping worth it.

AARRHHH!! , Don't listen to these Guy's .
Of course You will get more watts by inducing excessive voltage .
Just make damn sure You have Your watt meter in line so that You won't miss
that spectacular split second of extra watts.

The only problem with this, is the high RF interference these supplies could produce as there is no RF filtering built into them.

> Thats usually what happens with switching supplies good for non RF use.

Poorly built/designed ones anyway.
I power my whole bench from a switcher, FT-847 160-10,6,2,440 rig, two scanners, two fixed 2m rigs, and 915 MHz TV transciever, and various test gear.
There's measurable noise but only just, and not at any interesting frequencies.

The beep takes over the switching. The radio should receive without
a mike if you are hooked up right. The transmit wire from the mike
keys the beep. The beep switches the T/R leads. You have to solder
them to the tabs on the beep. The receive wire from the mike is
not attached to anything.

Dave, thanks for the reply. Just to fill in the details I missed on the first post, yes, checked the mic. Actually, putting a d104 on it made the condition worse. Stock mic was the best sounding, or more like put the least signal into the ailing part. The receive side of the rig is unaffected, sounds fine. Did a few test talks on sideband tonight. There was also a problem in this mode. The operators I had contact with reported weak modulation on sideband and I noted very low RF output, even at 100% mic gain (under 10 watts maxed out swing - compared to 22-24 watts on AM). What WAS interesting is that they all reported that the audio DID have the higher frequency components of the audio present on sideband. I also checked the output of the PA and just talking thru it the audio spectrum seemed to be normal. This radio has had the mod limiter clipped and the "high power conversion" done, a "dial-a-watt" installed and its been channeled. Also, it worked fine for several years after the mods were done, it just up and started this one day between keyups.

Your suggestion of sweeping it with the scope was what I figured I was gonna end up doing. Have to track down who borrowed my signal generator before I can go into that. Was really hoping that someone could "reach into the bag of tricks".

If / when I track it down I'll be sure to post the results back to the group.

Reminds me of a device that "Kris" manufactured in the early 70s. It provided about 135 vac instead of 117, so you just plugged the rig into that via the wall receptacle. Not very good on the radio, but you would see a few watts increase. Not worth it, really. it was called the "Range Boost". LOL....Any of you guys remember that? It was in the old Henshaw's catalog for several years.

Actually, you added a few crucial pieces of information. The fact that receive works ok, and the PA function works ok, pretty much eliminates the majority of the audio stages. Couple this with your report of low SSB power (But good audio fidelity), and I am suspecting that the problem is in the regulator/modulator area. You should be seeing a full 12V+ on the collectors of both the final and driver in SSB mode. This should allow you to see full power. If the voltage is low, then that suggests that the regulator is not biased at full "on" in SSB, and a signal of a problem.

IS the AM mode still producing the proper power and the proper modulation waveform? My guess is that looking at the modulation on a scope will reveal that something is not right. Check the regulator/modulator area first.

You should stick to opposing the law and feigning ignorance at courtesy
and common sense, and leave the troubleshooting to those of us that have
been doing it for longer than you've been alive....

Had your momma been a person of moral conviction, she would've told you
that if you can't say something nice, don't say anything.

>

A bunch of people who push the limits of good engineering practice for
the sole purpose of stretching the limits of illegality, doesn't sound
like the best place to find solid troubleshooting advice.

damn, first you talk about my mother then you say if i dont have anything nice to say not to say anythinga t all. when will you start following your own advice?

>A bunch of people who push the limits of good engineering practice for
>the sole purpose of stretching the limits of illegality, doesn't sound
>like the best place to find solid troubleshooting advice.

sounds like a touch of jealousy mister hall. whats the matter still upset because you cant hang with the real cb techs? its amazing how on one hand you compare yourself and claim to be better than these cb guru's and on the other hand claim they dont know what there talking about. eitner, tollfree, concreteman, and the others blow you away when it comes to offering helpfull and accurate info regarding cb radios on a daily basis and here you are all high and mighty because your trying to help just one guy. go back to playing with your davemade cb amp.

Dan is right. What the heck? You don't
need no "steenkin badges" on ham radio anymore! (do you ??)
Some guy who calls himself "orange blossom" checks into
the 75 Meter 3.860 Militia Net at 8:00
PM EST every night. Guy don't have any ham call
and is welcome checked in by the NCS "no-problemo".
[O.B. is allegedly with the Michigan Militia
out of Dexter Mich. Mr. FCC] Guess what also..
..they've now established 7.275 mHz SSB
(40m) as the "24/7 Michigan Militia callup freq"
or so said someone up there last nite. No license
needed too! real nice.

(So much for Mr Hollingsworth's "stellar"
enforcement record eh folks....?? Better send
in Homeland Security pronto Uncle Sam...)

Yes, I have now reread it a few times and have concluded that I do not have
enough
skill and education to use the power meter to measure the non-dead key
output accurately even though
the power meter has a PEP setting.

I may take another run at the test by generating a tone at some frequency
using my PC and
some custom programming. I will then take the sound that comes out of the pc
speakers, record it on tape and
take it out to the cb and play it through the mike.

Of course this is nowhere near as accurate as Bill E.'s scientific approach
but I want to
see if I can make the PEP measurement exceed the AVG by using a steady
modulated input.

I want to put this to rest once and for all. It seems that many of our ham friends here, have used the excuse that "I can work the world with 1 watt, so YOU don't need an amplifier". Well, lets set the record straight:
Misleading statement: " I can work the world with 1 watt". Facts: You can work the world with 1 watt, IF the ionospheric conditions are proper AND you are on a suitable frequency band. You CANNOT do it anytime you want, you are at the mercy of mother nature. Secondly, what most of these QRP guys have also failed to meantion, is that their "working of the world" was most likely via the CW mode. CW, because of its narrow bandwidth, offers excellent signal to noise ratios, easily 10 db better than a typical CB. If a CW contact were running 1 watt, and they were at your noise threshold, they would need to jump to 10 watts to make the same contact on AM. These "fantastic" claims aren't worth a nickel on the CB band, where most of us just wand RELIABLE (Meaning at ANY time) communications with other LOCAL stations. It all comes down to simple math. You want greater range, you need a greater signal, or a better mode. CW is illegal on CB (Not that anyone would bother using it). SSB is excellent for increasing range legally. But it is not for everyone. Comparisons to 2 meter repeater operations are invalid as well. Most repeaters are in ideal (high elevation, line of sight) locations, which facilitate easy communications. I've worked 2 meter simplex, with 25 watts. From base to base (With a 12 db gain beam) I can work farther than equivilent on CB. But base to mobile or mobile to mobile, is worse due to the rapid fading and "line of sight" characteristics of VHF. I take offense to the "holer than thou" attitude displayed by many hams toward Cbers. They flaunt their "superior equipment" and tell the CBers, to get ham licenses, and then are the first to complain to their ham buddies, that the reason the ham bands are going to pot, is because of all the CBers that are moving up there.
Ham radio and CB radio are both communications services. Both offer their respective users with a forum for enjoyment. Each service has it's own unique appeal that is not duplicated on the other. Ham radio is full of serious discussions and one can learn alot from just listening. On the other hand though, a constant diet of technobabble gets VERY boring fairly quickly. CBers are less technical, and as a result, are more like talking to "regular" people. Topics are more varied, and you can "fool around" without fear of upsetting the "kilocycle kops", and have more fun.

That is my point Steve it does not matter what the screen name says, it is what is said in the post no? and if he didn't look at the name and only what was said he would be running around filtering everyone? But we know he reply's to those in his killfile anyhow. I still can't figure out why he does that. He should worry about his SWR instead of what name I use. Go figure.

I'm always happy, Paul. And I manage to maintain my same email addy.

>Many of us do much to the dismay of some in >the group, but then again
I don't ever >remember anyone saying they were trying to >TOS you.

Hmm..if it's all that important to you, I still have the posts where
Lelnad KC8LDO claimed he had me kicked off webtv for forging and for
giving out his home number to someone that responded to his forged ads
of me. When he realized he was wrong, he quickly posted another unsigned
"email" claiming it was from an inquirer that was given Lelnad's number
by me and he was upset FOR Lelnad (chuckle). Lelnad even went as far as
to say that if he and this "guy"" and any others had any complaints
about me, that they should send the stuff to webtv abuse department and
maybe "collectively "they" (meaning Lelnad) could get them to "thump" me
or "drop a rock" on me. You seem to suffer from selective memory or are
missing posts. Don't worry..it's exactly why I point these type things
out...I don't want people like you to miss such things.

hey doc, i wish i could filter your fat ass but as fast as you break TOS violations and have to get new ISP's its hard keeping track of you. i never seen a big man move so much.

>Tim, what TOS violations has he broken, I >have yet to see any in this NG. You guys are >really desperate to silence those against >Illegal CB.

He didn't break any on the group. If Paul wishes to share with you what took place, that is his business, but he most definitely broke his ISP rules resulting in termination of his service. Once again, it has nothing to do with silencing anyone...on the contrary...those that have no skills at communication get frustrated and allow their ignorance to control them resulting in stupid decisions that break rules.

Busch,
That's really odd, because I've changed my server
once in the last three years. The former server quit.
If you will follow the directions for your browser,
you should be able to filter me easily.

I would probably question your flash over statement... it's not a
given to flash over.

> >Why? Because the 8877 has a grid ring that makes a very direct,

The text was posted using information based on actual examples.
posted on amp at www.contesting.com, within the last three weeks...

> > If you ground
> >the grid VHF-style, with finger-stock contacts directly on to the grid
> >ring and fixed directly to the chassis, then the tube will not oscillate

> is impossible to prevent an amplifier from oscillating under those
> conditions, even if it's built with the 8877. If you remember anything
> about these posts, remember this: If it can amplify, it can oscillate.

Its not my text, it's from an Well known English RF Engineer, RSGB
Author and friend via the previously mentioned list server. Posted
based on a conversion project mentioned by another RF Engineer
who just completed a working HF 8877 amplifier.

> >For glass tubes without a grid ring, such direct grid grounding is not
> >possible, which is why we have to use Plan B - parasitic suppressors -
> >to reduce gain at VHF.
>
> Parasitic supressors are a good idea with any RF power amplifier, the
> grounded-grid 8877 included. To not include even some basic supression

> the added protection might just cost you a very expensive tube.

These guys are RF Engineers, medium & large amplifier designers and
broadcast transmitter designers currently working in the high power
rf amplifier field. I know them well and take their word as gospel
based on a solid long term track record.
Unless your willing to take your statement to the "amps court of
review", I will continue to believe their statements have more
valid information than yours do.
It's the same large list of rf people I submitted my sweep tube
amplifier text to a while back. No errors were found... I don't
think you even tried to look for it.

>
> Here's what Eimac says about grid screening:

Eimac has had their share of technical issues...

> http://www.cpii.com/eimac/sec2-2.htm

I believe your referencing a copy of "Care and Feeding of Power
Grid Tubes". Nice older book with some slightly dated material;
I have at least two copies.

What point would you care to make or add about the page..? In
specific grid screening..?

>
> "The additional grid serves as a shield, or screen, between the input
> circuit and the output circuits of the tetrode, and is called a
> 'screen grid.'"

ZZZZZZZZZzzzzzzzzzz..... (snore)... so where are you
going with the above...?

>
> Your misunderstanding of vacuum tube fundamentals has led you and your
> mentor to believe the misguided notion that the screen grid is
> responsible for eliminating neutralization in a grounded-grid amp. But
> both of you have apparently abandoned the logic of realizing that if
> this was true then no neutralization would be needed for ANY
> common-cathode amplifier as well, which, of course, is not true.

Where do I or anyone else in these posts say that every cathode
amplifier
does not need to be neutralized..? The technical point that needs to be
made is less Cgp

Many of my friends (and mentors) referenced are extremely well educated
RF Engineers and authors working in the field. Drop on by the list
server and learn a thing or two... The actual number of available
active
amps members reviewing and talking these issues over every day is in the
hundreds. You are only one fly on the windshield...

Cute twist of words in your above post.
None of use claim the screen grid is solely responsible for the
elimination of the neutralization requirement in a grounded grid
amplifiers.

>
> Since you don't want to bother with the books, I suppose the internet
> will have to do. Here's another link from Eimac to get you going in
> the RIGHT direction with tube power amplifiers:

Have the hard copy... If you compared an original to the web posted
copy, last review by amps members people found it to be incomplete.

>
> http://www.cpii.com/eimac/PDF/Section2.1.pdf
>
> Note the typical applications of low mu and medium mu triodes. Also

> amplifiers.

Sure, but cautions abound using specific types in grounded grid
applications. That would be the 4cx250b as an example.

> Also notice that Eimac DOESN'T make sweep tubes.

they also don't make rf transistors...

> > His weab page goes through almost daily review by
> >people on the cutting edge of current amplifier technology. He
> >has many published articles on the subject of tube rf amplifiers.
> > http://www.vcnet.com/measures
>
> And Richard Nixon was President.

You just can't face the facts too well. So far, his and the
other people I reference have hundreds of articles and 20 plus Radio
Handbooks to their credit. I'm still waiting for you to
provide a reference or two.... a web page or two... an article
or two... I've even said please more than once...

> >I feel pretty safe agreeing with him and my books, you keep
> >your incomplete dated text book opinion for yourself.
>
> I don't agree with anyone until I can verify the facts for myself.

We'll be waiting for your verified facts.

> is immune from parasitics.

Not much more that I would care to do to make you happy. You
disagree with the two well known high power amplifier experts;
posting the text from which I reference. Archives easily reviewed
at www.contesting.com No one is going to force you to keep
your head in the sand.

> >> >Your simply wrong again Franklin... or frankie...

> later 'revised'. You are a liar, Skippy, plain and simple. And I have
> proven that 'fact' many times in this conversation. Of course you will
> probably 'revise' that fact in your reply...

See.... I knew you were going to try cover your fanny by using the
FCC web page. Well bucky... If I scan the actual license image and
cover the personal information, are you going to claim I altered
the copy..? If you agree, I'll scan the top section of the current
License, black out the name and personal information and place it on
the web for your review...

>
> I think nothing more needs to be said.

Yeah, you're hiding behind the FCC web page... which is different
from the original actual License hard copy I have. But your going
to find a squirming' way to avoid the truth no matter what I do.

>
> P.S: Keep checking my site. I plan on updating it soon, and will be
> including new stuff as well as some other things that were on the old
> site. Many of them are far more complicated than an amplifier, and

I was referring to an actual FM Broadcast Transmitter using an
8877 grounded grid layout, on the air as I type this. The comment
was not directed at your personal boat anchor.

I bet it works as well as those "internal cellular antenna boosters" they
were selling all over late-night TV a while back.

Tom

1819. More Twisted Lies

You mean this one Twisted? Sort of strange the guy send an E-mail to YOUR address and ended up getting MY phone number back in the return E-mail FROM YOU. You going to try arguing the "saucer men" where using your account when you weren't looking? Also as you can well see the idea about getting your WebTV account canned did not orignate with me. The above rubbish you wrote is just another example of the lies you spread around and I take great pleasure in pointing them out to people.

On Sun, 8 Apr 2001, Scott Leeland wrote:

=========================================================================
=====
So I called the number and got your answering machine.

Now, from this I would think you MIGHT be able to get Webtv to drop a
rock
on their kid.

I haven't got any more information than this but if there is anything
else
I can do I would be more than happy to assist with this.

If you would like to file the first complaint with Webtv and then give
me
the tracking number I would be happy to file a supporting complaint
with
them.

If you get more calls I would encourage you to get them to file the
same
complaint with Webtv. With a group of us it looks like we could
easily
```

get this kid thrown off Webtv. And with an identity we could get him
marked in a variety of different places.

Thank you for helping combat fraud and spam on the net

My apologies for bothering you, let's make a project out of him.
Don

I have used the same name for weeks on end like I said what is in a name,
why don't you tell this to Timmy nebro or skippy? the same reason you don't
like me changing them makes me want to create 5 more tonite, you guys worry
about the wrong thing you should be worried about all the law breakers in
this NG, instead of a guy who changes Nic's That is really lame if you ask
me. Steve if you came out here with Chevyholic i wouldnt say a damn word to
you why should i care Kill files/filter don't do a thing because when you
quote someone who is killfiled by someone else they then see that post
anyhow So they are really very impotent, the mere fact landdick replys to
me either via another post or directly also shows how in effective they are.
Self Control is the best Kill Filter and it has been shown these guys lack
it severly.

Source record: 144365

: Brian Griffey <briangriffey@worldnet.att.net> wrote:
: In looking at the schematic for the amplifier... I see it has no bias for
: AM. Why?

There is a school of people who use "rf derived bias". Nothing I'm a fan
of, but it's been done for years.

: I also think that the bias source, through a 20 Ohm resistor is not capable
: of maintaining forward bias at higher drive levels.

One hopes to drive the devices with slightly less than the max recomended
mfgrs value.

: I also see one more thing... You show different component values for the use
: of MRF455 and MRF421 transistors... but yet the transformer ratios appear to
: be the same for both. I hope this is an oversight... as you know the
: impedances of those two devices is considerably different.

The impedance is low for both devices, the reactance is different per
device.

Not the best circuit...

As shown, it has hot switching TR problems, no low pass filtering,
lacks a proper bias circuit and adequate reverse polarity protection.

In short, Frankie would call it a "poop generator".

cheers

I picked this radio up at a garage sale and brought it home and found that it had the channel display giving off some weird display.

D551 is on the module.

Does Radio Shack still order those parts or what?

I can solder it back in myself. Easy.

I would like to get a replacement for it.

I'm gonna try callin' that 800 number for radio shack to order a new display module. not the chip.

The beep takes over the switching. The radio should receive without
a mike if you are hooked up right. The transmit wire from the mike
keys the beep. The beep switches the T/R leads. You have to solder
them to the tabs on the beep. The receive wire from the mike is
not attached to anything.

1834. CB Repair & Mod. Books 40% Off

Newsgroup: rec.radio.cb
Date: 2002-11-20 02:13:36 UTC
From: Lou Franklin <lou@cbcintl.com>
Message-ID: <c0sltuouo6jsiii9klruhn92hls2srghhe@4ax.com>
Source record: 144370
Cross-posted to: rec.radio.cb,rec.radio.swap

To learn the technical TRUTH about CB Radio without all the hype from people who are just plain ignorant, check out the following books from CBC International. They're selling right now at a big discounts on our EBAY & AMAZON stores too.

Check it out! Go to this link:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewSellersOtherItems&userid=lou@cbcintl.com&completed=0&sort=3&since=-1&include=0&page=1&rows=25

To see exactly what these books look like, plus all the specific, chapter-by-chapter details, see our Web at:

www.cbcintl.com

Some of the books included are:

BOOK #1: THE "SCREWDRIVER EXPERT'S" GUIDE To Peaking Out & Repairing CB Radios. List $25. The most popular "big dummy's" guide ever published on do-it-yourself CB repairs & modifications. Covers peaking of receivers, transmitters, modulation, mike problems, antenna & SWR problems, detailed frequency modifications for both crystal & PLL radios. Loaded with charts, illustrations, and specific instructions for most brands including the new export models. This latest edition also covers slider and broadbanding tricks, FM conversions, and much more!

BOOK #2: THE CB PLL DATA BOOK. List $20. The only complete reference source on CB PLL synthesizer circuits ever published! Detailed PLL theory explained in layman's terms. How they work, and how to modify them for many more channels. Includes specific PLL block mixing diagrams, truth charts, & IC pin function diagrams for nearly every PLL chip ever used. Covers all the most popular U.S. & export chassis, with specific listings of all models using the chip.

BOOK #3: UNDERSTANDING & REPAIRING CB RADIOS. List $42. Giant 370-page technical book for the professional repairman. Picks up where the "SCREWDRIVER EXPERT'S" GUIDE leaves off. Includes circuit descriptions & troubleshooting guide for 23- & 40-Ch., crystal & PLL, solid-state & tube, AM, FM, SSB, CW, American & export models. Covers test equipment (& where to find it), transistor basics, synthesizers, receivers, transmitters, power supplies, T/R switching, antennas, interference, parts & accessory sources. Over 350 illustrations including schematics, charts, and photos. Huge subject index also lets you look up repairs by symptoms. This is "must" reading for any serious CB technician!

For details on our Galaxy-Ranger Service Manual (2nd Ed.) go to:

www.cbcintl.com/galaxy.htm

****
Who are we? Since 1976, we've been THE source for CB Radio
technical information & high-performance CB accessories!

doc if you think twistie is nutts ......well whatever..........but why
don't you carry your ham ass over to the ham radio newsgroup and leave
us the fuck alone man.........you and the rest of your candy ass do
gooder terminal technician class hambos are really stinkin up the
place..............you seem to think that we, because we do not have
fuckin letters by our names cannot reason something out or need your
help or your elmer shit.........that amigo is a damn mistake and a big
one........we do not need elmers here..........and we do not need
someone holding our dicks while we take a piss sir........so please
give it a rest............after all,.... old chap... you are not our
collective daddy.........sooooooooooo cuz are you into freaks and
peeks..........?????

```
You mean sorry Burt, right? We're glad you're looking for another job. We
can't afford to have any more hams without jobs here--they turn into old
ladies FAST ! Just ask N8, Vooble, and all the ham nuts the full moon is
affecting tonight! All I got to say about your current job is this is what
you should say to them "Share the moment--share NO JOB DEATH !" ! The
Babylonian eggheads in the govt. & out will say that anything like the
"economy" is "growing." I believe this is communist double speak Kensian
propaganda for "we take yo job, you go to McGaggles to work!" The Federal
Reserve is a private corporation controled by foreign bankers that Andy
Jackson called VIPERS that are back making a Deut. 28 job on the USA. 2
Chronicles 7:14 IS the answer! Ask someone you know "will you repent today,
so I can have my job back?" ! ! !

You will blow your sound chip @ 18v or so, and you'll have NO audio then.
Plus maybe you'll blow the final with higher voltage.

Understood, my friend. We just had a round of layoffs last Wednesday. Next
week we get to listen to an "All hands meeting." We get one of those
whenever a significant amount of blood has been spilled. Company morale is
not very high at the moment, but we're trying to hang in there...hopefully
until the economy *really* does turn around. My fingers are crossed for you,

Jim. Thanks for the article, Dave.

>In short, Frankie would call it a "poop generator".

Unlike you, I rarely use the euphamism 'poop', opting instead for any
word or words that best describe the concept without being influenced
by a holier-than-thou attitude. I would call it a 'splatterbox'.

I love this "hypothetical theories" I have and still keep
blocking him. He knows when this happens, because no
one responds to him, he figures it's time to change nics to
troll the newsgroup.
Lets try this theory George, block me, I don't even begin
to change names like you do, so block me, then you have
no excuse to respond, do you?

LOL!!!!, have it George, talk to you later Mopar.

Go see Mystere at the Mirage. it's a great show.
If you want a great Lobster meal in Vegas, go to the
Rosewood Grill, it might be Mafia run, but they have
great Lobsters.

Dont bothur. ifn you walk around with a small coppur rod bout four feets long you kin groun the phone to a light poast with the rod and all those nasty little Hz's will be harmluss and go into the sidewak or up the poal. This wurks better than the ham fest doodes that walk aroun with the luminum hard hats and raydiuls on teh sides. they lurned this after they herd all kinda dits and dashes in theyre heds even when they was sleeping. now they kin sleep reel good
I herd also that if a ham has lots of tin foil the ham kin sleep real good an not havta study up for a code test this way cuz it comes into his hed real quite like an it dont waken him up with worrie bout taking a test or nuthing
Someune done tole me this is the way Dumass Donnie done it but somefin went rong an the tin foil got somefin like a millyon or 2 volts in it and fryed donnie in the hed. they said donnie tuched his coppur rod to the rong light post and lit up like a sparklur and spun round an roun an roun an roun until his tin foil meltud an his eyes wen all ever wich way. an he even meltud his big ol 20 pound belt buckel to his belly an thas why he wakls all bent ovur the way he is. they took donnie to the veturenaryan but damige was dun an ol donnie nevur did recuver liken the way he wuz uset to be. The vet tole donnys mom that donny had permnent brane damuge an moste likuly wuld talk reeeeeeeeeellllll slooooooooow the res of his lifetime an shuld get therupie. donnies mom siad she dint have $ for therupie an her son wuld just havet to lern to live with his disabiluty. she said she will lurn to lissen to donnie reeeeeeeellll slooooooooow so she under stans him an when she reeds him his bed time storys she wil read reeeeeeeellll slooooooooow so donnie kin unnerstan.
now you know why he tawks so slooooooooooow an yuo guyz shuld be mebbe more unnerstannnig bout his disubiluty an stuff cuz donnie caint hep it. it wuz a acksidunt an donnie wont never more agin be stik his ground rod where it dont belong cuz he lurns reel fast. an donnie dont have a brain toomur eethur cuz the vet siad he is mostly back to normul an wont git any bettur than he is. already.

yep sorry it offends you so much get over it.

: >> like I said what is in a name,
: >
: It's your only identity on any board,the more you change it,the less
: credibale you are. Not so hard to understand.

It sure is hard to understand. The name on the post shouldn't change if that particular post is credible or not. I am the same person who said the same thing 100 nics ago. What difference what nic I use It doesn't change what is being said. Not to hard to understand.

: >
: >> why don't you tell this to Timmy nebro or skippy?

Hi Scott!

1861. Call for National Day of Prayer in View of Present Threats Against U.S.

Newsgroup: rec.radio.cb
Date: 2002-11-20 08:08:08 UTC
From: angelmystry@aol.com
Message-ID: <20021120030808.18548.00000172@mb-fp.aol.com>
Source record: 144397

http://www.angelmystry.com/seekye/worldprayer.htm

I have been moved to start a grassroots campaign to ask the President, Vice-President, Members of Congress and State Legislators to call for an IMMEDIATE National Day of Prayer to be held within the next 7 - 10 days. This would include all faiths, religious beliefs, etc., similar to the services held in Washington, D.C. and elsewhere following the September 11th tragedy.

This is calling for an email campaign so that our voices may be heard clearly by this nation's leaders. The campaign is to be extended to religious leaders, other organizations, etc., to get this whole country involved.

Please check out the following website, copy and paste to your heart's content, and email your legislators. We are in a time of sincere threats to our nation, and it is time that we pray humbly to God for His mercy and His blessings upon this nation and the world.

I respect each person's right to their own belief systems. I firmly believe that when this nation got on its knees and prayed, following 9/11, that many other disasters were mercifully stopped. I believe this intervention was God's response to the millions of prayers that were said worldwide.

You will find links on the page to a Contact Page with the email addresses, a Suggested Letter, What YOU Can Do, and under the link "One Nation Under God" copies of some of the wording of our nation's documents (with the words highlighted where they talk about our nation being founded on God's principles.)

Please feel free to write your own letters....I've worked for 12-18 hours/day for the past several days on all this and I'm beat, so I'm not sure that if I looked at it in the morning with a fresh cup of coffee, it would make complete sense. The good intentions, and the love of this country, and the people of the world should be enough! Please overlook the flaws, and jump in and let's see what we can do!

If you feel so moved, please also send a copy of this message and the website address to anyone else you think might also help.

We don't know HOW REAL these threats are, but if we unite now in prayer, collectively, perhaps further disasters will be averted through God's infinite mercy. Many of the other speakers I've known on Keen are being given visions, also. Please, PRAYERS ARE ANSWERED!!!

http://www.angelmystry.com/seekye/worldprayer.htm

May God Bless You All.

I can think of no example you would be capable of understanding.

<snip>
>I would probably question your flash over statement... it's not a
>given to flash over.

Remove the load and leave the tank? It's gonna flash. Period.

<snip>
>The text was posted using information based on actual examples.
>posted on amp at www.contesting.com, within the last three weeks...

If it was FOUR weeks old would you call it "dated technology"?

<snip>
>Its not my text, it's from an Well known English RF Engineer, RSGB
>Author and friend via the previously mentioned list server. Posted
>based on a conversion project mentioned by another RF Engineer
>who just completed a working HF 8877 amplifier.

I don't care who posted it. Like I said; if it can amplify, it can
oscillate. You still don't understand that parasitics are a product of
the circuit, NOT just the tube, and NOT just the tube's anode circuit.
All you need is a resonant condition that feeds a signal back through
the tube. (It's becoming obvious that you don't understand the
principles behind oscillation, either.)

<snip>
>These guys are RF Engineers, medium & large amplifier designers and
>broadcast transmitter designers currently working in the high power
>rf amplifier field. I know them well and take their word as gospel
>based on a solid long term track record.
>Unless your willing to take your statement to the "amps court of

>valid information than yours do.
>It's the same large list of rf people I submitted my sweep tube
>amplifier text to a while back. No errors were found... I don't
>think you even tried to look for it.

I find it hard to believe that ANY electronics engineer would
recommend building high-power RF amps without any form parasitic

supression. But if you want to take their word on blind faith then by all means go for it -- you are gambling with your money, not mine.

<snip>
>http://www.contesting.com

That's interesting: Your other favorite amp god (Measures) clearly disagrees:

http://lists.contesting.com/_amps/2002-August/031417.html

And on his site he even has a great picture of a nuked 8877 from an amp that doesn't use any parasitic supression (and also sells retrofit supressors for the same amp):

http://www.vcnet.com/measures/8877.gs2.JPEG

I especially like his phrase describing one individual that claimed to have never had a parasitic with his 8877 amps -- "the 'not invented here' syndrome" -- describing perfectly the lazy RF design practices of some of your so-called 'experts'.

>> >> >Your "predisposition to parasitics" is not really a good term...

What am I tripping over? Your explanation of why some tubes are prone to parasitics? I can't trip over it because you haven't provided it!

<snip>
>> http://www.cpii.com/eimac/sec2-2.htm
>
>I believe your referencing a copy of "Care and Feeding of Power
>Grid Tubes". Nice older book with some slightly dated material;
>I have at least two copies.

What makes it 'dated'? What information in there is not accurate?

<snip>
>Where do I or anyone else in these posts say that every cathode
>amplifier
>does not need to be neutralized..?

You say it all the time. Your argument is that grounding the screen reduces the Cgp of a tetrode/pentode in a grounded-grid amp. But the screen grid is effectively grounded (unvarying DC potential) in a common-cathode amplifier as well, which changes the EFFECTIVE Cgp EXACTLY THE SAME as grounding the screen in a grounded-grid amplifier.

Therefore, if 'grid screening' eliminates the need for neutralization
in a grounded-grid amplifier, it MUST ALSO do so in a common-cathode
amplifier.

> The technical point that needs to be
>made is less Cgp

The Cgp of a TUBE is reduced when you ADD a screen grid TO A TRIODE.

>Many of my friends (and mentors) referenced are extremely well educated
>RF Engineers and authors working in the field. Drop on by the list
>server and learn a thing or two... The actual number of available
>active
>amps members reviewing and talking these issues over every day is in the
>hundreds. You are only one fly on the windshield...

I couldn't find any post where anyone even suggests a reason why
grounded-grid amps don't require neutralization. Maybe you should ask
the question yourself and see what kind of answer you get. Of course
it won't be the answer you expect, so you better not blurt out your
ignorant theory to the amp gods before they humble you with their
reply.

>Cute twist of words in your above post.
>None of use claim the screen grid is solely responsible for the
>elimination of the neutralization requirement in a grounded grid
>amplifiers.

You have never provided any explanation other than "reduced Cgp" and
"grid screening". The fact is that Cgp means nothing at all in a
grounded-grid amplifier because the grid is grounded -- i.e, any
signal fed back through Cgp is sent straight to ground at the grid
(...grid-to-plate... get it? or do you need a picture?) And if the
cathode was so well screened from the plate as to prevent feedback,
then the plate wouldn't get any signal from the cathode and the amp
wouldn't work at all.

I have said these things many times before, yet you have refused to
verify them for yourself. Or perhaps you think logic is dated
technology...

>>
>> Since you don't want to bother with the books, I suppose the internet
>> will have to do. Here's another link from Eimac to get you going in
>> the RIGHT direction with tube power amplifiers:
>
>Have the hard copy... If you compared an original to the web posted
>copy, last review by amps members people found it to be incomplete.

If you have the hard copy then I recommend you read it. It may not be
complete, but it's more accurate than your voodoo theories.

>>
>> http://www.cpii.com/eimac/PDF/Section2.1.pdf
>>
>> Note the typical applications of low mu and medium mu triodes. Also
>> notice that Eimac, a manufacturer of power tubes for longer than you
>> have been alive, recommends the use of high mu triodes for RF
>> amplifiers.
>
>Sure, but cautions abound using specific types in grounded grid
>applications. That would be the 4cx250b as an example.

It says no such thing and it provides no such example. You are lying
again, Skippy.

>> Also notice that Eimac DOESN'T make sweep tubes.
>
>they also don't make rf transistors...

Because they don't make semiconductors. They DO make tubes. They make
power tubes for just about every power tube application: AF, RF,
industrial, medical, etc. They even make power tubes with maximum
power ratings even LESS than most sweep tube amps.

But they don't make sweep tubes.

<snip>
>You just can't face the facts too well. So far, his and the
>other people I reference have hundreds of articles and 20 plus Radio
>Handbooks to their credit. I'm still waiting for you to
>provide a reference or two.... a web page or two... an article
>or two... I've even said please more than once...

I can face the facts, and I can also verify them. So far, none of your
"facts" can be verified, even by you. Your only method of verification
is to 'pass the buck' to some web page without even pointing to any
specific text. Anyone can put up a web page, and anyone can publish
articles, manuals, or textbooks. NOT everyone can write a textbook
that can hold up to scrutiny by accredited colleges and universities
around the world. If you want information that's valid (facts that are
not 'subject to revision'), check out your local library for textbooks
written by people with high professional and academic credentials. If
you just want something developed by the process of hit-and-miss and
don't care why it works, just follow the step-by-step directions
provided in "Joe Schmoe's Book of Big Amps". And don't put too much
stock in the subsequent theories; "Hey guys, I built an amp with an
8877 and it worked without a parasitic supressor; this must mean that
the 8877 is immune to parasitics!"

>> >I feel pretty safe agreeing with him and my books, you keep
>> >your incomplete dated text book opinion for yourself.
>>
>> I don't agree with anyone until I can verify the facts for myself.
>

>We'll be waiting for your verified facts.

I'm still waiting for your's. Like, what amp is legal for 24 to 35 MHz? And what TV used the 6146?

<snip>
>> Like I said, there is no evidence to support your claim that the tube
>> is immune from parasitics.
>
>Not much more that I would care to do to make you happy. You
>disagree with the two well known high power amplifier experts;
>posting the text from which I reference. Archives easily reviewed
>at www.contesting.com No one is going to force you to keep
>your head in the sand.

Except that those two "well known" experts (even though I had never heard of them before) seem to disagree with each other. Matter of fact, I noticed the thread about an AL-1500 with an alleged 1.5x parasitic. I read through the entire thread. What I saw was nothing but speculation, ranging from the mundane to the totally absurd, and never ONCE did I see anyone suggest the guy get in there with a GDO and find out where and why the oscillation was occuring. On the contrary, there was even one person that said it was absolutely impossible for the amp to be defective, which really drops a fly in my soup since it is impossible to determine that from the information that was posted.

And not ONCE did I see a post where anyone suggested that grid screening or "reduced Cgp" is a reason why grounded-grid amplifiers don't require neutralization.

There is a lot of good info in those archives, but those people aren't gods that you can take their word on blind faith. As with everything else in life you have to verify the facts for yourself. In fact, I have asked you many times to verify my statements, yet you seem to think that your own statements are gospel. Maybe you think that because you hacked a few amps and subscribed to an amp list that you deserve from rrcb the same god-like respect you give those on the list. Wrong-o Skippy, especially when you claim you built a BC amp with an 8877 that does 10 kW FM! (I should subscribe to that list just to post your claim -- now THAT would be fun!)

<snip>
>> >Da' facts are subject to revision,
>>
>> There's your problem, Skippy. Your seem to revise your "facts" to suit
>> your purposes. For example, remember that callsign you emailed me?
>> Well, it is listed as IG, not IB as you claimed. And the license was
>> issued AFTER the 1997 consolidation, so it was NOT issued as IB and
>> later 'revised'. You are a liar, Skippy, plain and simple. And I have
>> proven that 'fact' many times in this conversation. Of course you will
>> probably 'revise' that fact in your reply...

>
>See.... I knew you were going to try cover your fanny by using the
>FCC web page.

That's stupid. You sent me the callsign with the express purpose of me verifying it on the FCC website, and now you are going to claim that the FCC is wrong? Well, Skippy, what do you consider to be an authoritative reference if not the FCC? Or is the FCC website using "dated technology"?

> Well bucky... If I scan the actual license image and
>cover the personal information, are you going to claim I altered
>the copy..? If you agree, I'll scan the top section of the current
>License, black out the name and personal information and place it on
>the web for your review...

Scan it if you want, I couldn't care less. Digital images don't mean anything because they are so easy to edit.

>>
>> I think nothing more needs to be said.
>
>Yeah, you're hiding behind the FCC web page...

That's not 'hiding', Skippy. It's using an authoritative reference to verify (or rather, dispute) your 'facts'.

> which is different
>from the original actual License hard copy I have. But your going
>to find a squirming' way to avoid the truth no matter what I do.

And you are going to say anything you can to defend your lies.

>>
>> P.S: Keep checking my site. I plan on updating it soon, and will be
>> including new stuff as well as some other things that were on the old
>> site. Many of them are far more complicated than an amplifier, and
>> they might be a good test of your alleged electronics expertise.
>
>and the web url is...?

Look it up, Skippy. Maybe in the process you will find a few of those posts you missed.

Definition of the SuperBowl
If 10,000 CB'er's are on the SuperBowl
then only 1000 can be heard some of the times
& only 100 can be heard most of the times
& only 10 can be heard all the time
This is a great example why the bowl is not for the weak!

An observation. It's typically a given that the parents are usually
responsible for the peculiarities of their children. Your blatent
disrespect for the law and the rights of other radio operators, and
likely other people in general, was clearly the result of your parents
using a "hands off" approach to child rearing.

What's a "real" CB tech? Someone who can make roger beeps in 7
languages?

> its amazing how on one hand you compare yourself and claim to be better than these cb
> guru's and on the other hand claim they dont know what there talking about.

A different "skillset". Just because one guy may know more "tricks" does
not mean that they understand the complete workings of any radio. My
specialty is troubleshooting and undoing the damage caused by other
"techs" who mod a radio beyond stability in that on going quest to be
king of the hill.
Other guys might be able to make a radio perform better tricks, but when
it develops a wierd problem, they come to me to fix it.

> eitner,

You might want to check in with you master "twistedhead", and get some
lessons on using google. There you would find many cases of help and
information that I offered up long before you were on this group.

Hello all

Wonder if anyone can please help me, I having been using CB for about 8 years now over here in the UK and my local area is dead! Hardy anyone on anymore and I really miss CB.

I will be traveling to Central Florida for about 2 months in a couple of weeks and would like to buy a CB out there.

I am after a little advice please, does anyone know if Central Florida still had a CB community? I don't really want to spend out and find no one uses CB in my area. What's the deal with licences? Over here in the UK we need a 1 year licence does America need a licence if so where could I get one from please? How many channels are America allowed to use and what mode? Are Multi channel radios against the law? Is it worth the risk having one? Do many users use the other channels?

Sorry for all the questions, like I said I would really like to use the radio whilst I am over in the US maybe someone can help me please.

Thank you very much

Stu 'Loose Cannon'

No license! You should find many to talk to. If for anything, they are a very handy tool on the highway.

You seem to have misspelled Jeep! I've taken the liberty (don't think I really consider that a Jeep) of fixing your spelling below. You'll notice that Jeep doesn't require all caps. The Jeep name carries(ok USED to carry, really turned to shit in the last few years haven't they?) so much weight and power you wouldn't be able to handle more than the capital J.

Hi FM, anybody can inform me what is the activitie of CW in 11mts?,
do u think will be interesting have stations working always CW in our
band? what do u think will be best way for to do? (I mean, QRG for call
and no disturb 555 e.g)
I ask u because a handfull of friends in ham bands are asking me for do
CW in 11mts, and really like I dont like very much ;-) I can´t
answered them. Your opinion will be wellcomed.
Thanks in advance

30LD001
Luis
==========

Appears cw is finding it's way into the freeband through the mainstream
and becoming more popular there than it already is. For those
interested, drop me an email and I will keep y'all posted when the next
round robin takes place.......

If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

I can't tell you why 17 is used in California, but I can tell you 17 is used mainly in Northern California. When you get up near Modesto or Stockton area 17 becomes the main calling/trucking freq for CB. As far as I know this extends up past Yuba city all the way out of California and then presumably people tune back to 19. Every where I've been in Central/Southern California 19 is still the main freq used.

From: rcranus@hotmail.spamcom (Perculator)
>LOL Nad, It is quite simple what happened >someone forged the initial twisty posts,

Not someone, Lelnad. Dick McCollum
was the first to bust his azz doing it in a hammie room....the posts are there for all to see. When Dick announced it was Lelnad, Lelnad attacked Dick on another subject entirely, attempting to redirect the topic immediately by making it personal with Dick, even going as far as saying Dick was attacking him for a grudge he allegedly held over a former debate.....please.

>some guys emails Twisty, he then thinks you >have something to do with it he then gives out >your phone number as a form of retaliation. >Then he tries to lie and cover it up LOl

Nothing to cover up. Lelnad said I was TOS'ed from webtv. He was wrong, as I did nothing he claims I did. Check out our TOS at webtv....very simple and enforced to the "T", just like the one on Nad's forehead. Merely but another of many fantasies that result in you guys wishing it so hard, y'all make yourselves believe it.

Yep, sorry Dave ... Bert, Dave **did** send this to me. I should have mentioned it, but I've been **really** busy hustling to find another job. My plant is closing next year (I have some time to play with). Xerox is laying off a bunch of folks - meanwhile, the government claims the economy is 'growing'. Hmmm ..
73 from Rochester, NY
Jim

They don't feel our pain, Jim. They bleed blue, not red, and like his daddy b4 him, throws stats and manipulated figures around and expects us to believe what he tells us, not what we are experiencing. Check this out...if the Iraq thing (or even Afghanistan, Pakistan, anywhere in the mid east) turns into a long "occupation", and we begin to lose Americans on a regular basis even more than we are experiencing now, and the economy continues to plummet (and it will), the GOP will be extremely hard-pressed to find a scapegoat to blame, and the voters will not fall for the same rhetoric of "the economy isn't so bad" that didn't work last time. Good luck with your search, Jim. I know what time it is..this time last year we were wall-to-wall tourists....the beaches are empty now.

1885. Re: UK CB to US CB in Florida

Newsgroup: rec.radio.cb
Date: 2002-11-20 18:29:09 UTC
From: 'Doc <w5lz@cwis.net>
Message-ID: <3DDBD475.6698529C@cwis.net>
Source record: 144420

Stu,
You should have no trouble finding someone to talk
to on the US 'CB' band in Florida. There may be more
of a problem find someone you ~want~ to talk to though,
there's a distinct difference in 'style' between the
US and UK 'CB' bands.
There's no license required, so that's no problem.
Give it a try, you might find it a bit different, but
still fun at times...
'Doc

1886. Re: Is there a way to use your computer as a cb radio?

Newsgroup: rec.radio.cb

Source record: 144421

Kevin,
There are a number of different 'computer/radio's
available, but as far as I'm aware of, none strictly
for 'CB'. Those that you do find are going to be
costly, and may not be modifiable. You might find
a web site that offers to let you listen to the 'CB'
band, but that's another one that I don't know about,
I've never heard of one only for 'CB'. Good luck...
'Doc

Hi Doc and Radio Fun

I can't wait to get over now, I am a wally anyway so that's no problem I am sure I can find someone to talk too.

A few more questions please:

Does anyone know where I will find a copy of the rules and regs for CB use in America (or is there none :)

I will need to get a new antenna can anyone please tell me a good place from where to buy a new Arial online?

Is it worth buying a multi channel radio? or should I just stick to 40channels (is it AM you guys use? UK is FM)

Thanks all

Stu

Kevin, as others have indicated, nothing for CB. I'm not sure if there is anything other than scanners for computers, and these require hardware as well as software. There is a software program which allows amateur radio operators to connect through their computer over the internet to FM repeaters worldwide, but a lot of checks are required before they activate the software. Although they say it can take an hour, it took over 3 hours before they were satisfied that the ISP address, e-mail address, and proper license class did, in fact, belong to me. Even then, the radio itself does not reside within the computer - it only acts as a link between the microphone, speakers, and internet. I won't say for sure if there are, indeed, no transmitters / transceivers made which go inside a computer; perhaps someone knows of one. Bear in mind that it would either need an external power supply or the computer would have to supply it - as if we need more loads inside the computer ;-)

Using the computer as a CB is not possible that I know of. There IS software that will let you control a CB with your computer however... As I can see so far, it is apparent that all the people who have replied have no idea about the software; which just happens to be FREE...

It can support a number of CB radios, and by the sounds of it, is fairly cheap to build the interface that is required. Of course, you will need to know a little something about electronics in order to interface your CB with the computer, but as it appears, pretty much everything you need to know is contained on the website below...

http://members.tripod.com/~Malzev/radiodoc/software.htm

This link, and many more can be found on my CB page... Drop by if you like...

That's all you can do.

> Akron/Canton got beat up pretty well too.
> I was lucky,just a few branches down..sigh.

About the spookiest thing I've seen while spotitng, is pieces of leaves,
floating down out of a blue sky. Towers were all around us, but overhead
was clear, and there were these pieces, up to quarter sized or so, some with
twigs still attached, floating down from as high as the eye could see.
Obviously somewhere nearby there were some trees getting hoovered, but
nothing that any of the spotters could see.

The F4 that hit Van Wert went through my county, I live about 6 miles from
where it dissapated.

Rules can be found here: http://www.reactintl.org/rules-cb.htm

10-Codes (will help you communicate):
http://www.roity.com/rc/cbradio/cbcodes.html

Antenna: Don't know. Someone else can answer that one...

Radio: Depends on how long your are staying... I'd suggest probably
starting out with a legal unit, and after a while progress from there if you
want.

Transmission: We use both AM and SSB..

>
> If it was FOUR weeks old would you call it "dated technology"?

Doesn't matter, I verified the posted information by the two
well known RF Engineers and believe it to be accurate until
better facts or information update or replace it.

Like your adding rectifier equalizing networks mistake. Mfgrs
updated their products and posted data sheets for the newer
devices.

> <snip>
> >Its not my text, it's from an Well known English RF Engineer, RSGB

> principles behind oscillation, either.)

You start your above statement with an off the direct issue/topic
generalized statement. We are talking about a tube that is

well designed and constructed, which does not require
conventional parasitic supresors for common HF and VHF
operation. That tube is the 8877 and some of its cousins.

We are not talking generic amplifiers which can be made
to oscillate.

Now you want to imply that I say it is only the tube or the
anode circuit... don't play games franklin.
Your bob and weave trying very hard to say that I restricted
specific parasitic sources to one cause.

You present any source material or text directly related to the
subject.... and we'll go over it. Otherwise, your still just
chasing windmills with your bitter pill poopy attitude.

> <snip>

So did it... so he was asked about the described working circuit
which lacked parasitic supression. He and another well known
Engineer supplied additional information about the circuit, the tube
and the reasons why the amplifier they actually built works well
without conventional anode parasitic supressors installed.

I picked up some very nice information in the exchange... of
which I'm happy to reference. But you just want to live
with your vintage - dated technology.
Get off your rather large web behind and go review the posts
at the www.contesting.com web site. Learn something new
for a big change in your narrow world.

>
> That's interesting: Your other favorite amp god (Measures) clearly
> disagrees:

Rich is a long time friend, who has yet to obtain a deity
status.

At that date and time in the thread... he had yet to see
the evidence which was substantial enough in fact and
backed up by a working example.
You could simply Email him and ask for his opinion.

> http://lists.contesting.com/_amps/2002-August/031417.html
>
> And on his site he even has a great picture of a nuked 8877 from an
> amp that doesn't use any parasitic supression (and also sells retrofit
> supressors for the same amp):

An interesting point often debated on the list server. Some claim
Eimac had some rather well known problem with 8877's, some
claim the applied circuits have problems, others chime in with
various statements. The debates have gone through years of
back and forth. One must also learn and avoid some of the
personal land mines thrown out by Author.

> http://www.vcnet.com/measures/8877.gs2.JPEG
>
> I especially like his phrase describing one individual that claimed to
> have never had a parasitic with his 8877 amps -- "the 'not invented
> here' syndrome" -- describing perfectly the lazy RF design practices
> of some of your so-called 'experts'.

That would be Ameritron Amp designer Tom, a nice guy with points
of his own to make. Not everyone takes Rich's word as gospel, but
many learn how to filter all the material to arrive at a logical mean.

Aside from the above, I believe a lot of what is specifically referred
to on that page is possibly sourced to both the applied circuits and
some well known issues with 8877 tube production.

The more recent 8877 conversion example by John does not
have the traditional shortcomings found in previous examples,
the end result is that his amplifier is stable without parasitic
supressors installed.

> >Nice try to side step... but you trip over your own feet.

Somewhere you try to twist out the idea that I say the grounded screen is
the reason g-grid amps don't require neutralization. I say it is only part
of a larger picture. Was a poor try on your part that doesn't float a
boat...

> > The technical point that needs to be
> >made is less Cgp
>
> The Cgp of a TUBE is reduced when you ADD a screen grid TO A TRIODE.

And...?
Effective C is also reduced when you apply that tetrode to grounded grid
operation. Nice 'eh..?

You can't seem to find much of anything except mean and bitter things
to write, despite your poopy attitude, the world turns and moves forward
without you.

Why don't you step up to the plate, join the list server and post the
question yourself..? Just drop the amp gods baggage at the door so
people will even talk to you.

Come on Mr. big shot, you've got the big mouth via your keyboard.
Time to step up and do some things for yourself for a change. You
can also ask about the rectifier equalization networks you love
and the reasons why grids are not tied to the plate in RF amplifiers.

> >Cute twist of words in your above post.

Go look up the circuit description in the SAI Handbook text I
referenced. Save us all some time while you eat your crow sandwich.
Your beginning to be a big time boar and a bitter boy time waster.

> I have said these things many times before, yet you have refused to
> verify them for yourself. Or perhaps you think logic is dated
> technology...

You are a master of word twist, but that's about it. You have yet
to provide us with any text, articles, web page material that you've
written. A lot of what you've posted indicates you have little if
any experience actually working on any tube rf amplifier. We just
get the impression you live to repost text book information which
has proven to contain errors and dated material and that your
not willing to resource anything further than a mouse click in
your narrow little world.

> >> Since you don't want to bother with the books, I suppose the internet

> It says no such thing and it provides no such example. You are lying
> again, Skippy.

You are a simpleton franklin with a poor taste for word twist.
Exactly where in the above text that I typed do you see the
"cautions abound" statement restricted to the Care and Feeding
Book..? If you would ever care to reference the original source
material (which contains the mentioned cautions), try the
SAI Radio Handbook, 18th edition... around pages 180. He
was an Eimac Engineer, probably one of the ones sourcing
some or much of the material in the Care and Feeding book
your dancing about via the CPI web page.

The statement remains as fact... nanny nanny boo boo to you..!

> >> Also notice that Eimac DOESN'T make sweep tubes.
> >
> >they also don't make rf transistors...
>
> Because they don't make semiconductors. They DO make tubes. They make
> power tubes for just about every power tube application: AF, RF,
> industrial, medical, etc. They even make power tubes with maximum
> power ratings even LESS than most sweep tube amps.

ZZZZZZZZZZZZZzzzzzzzzzzzzzzzzzzzzzzzz.....! (snore)

> But they don't make sweep tubes.

ZZZZZZZZZZZZZZZZZZZZZZZzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz...!!!

> <snip>
> >You just can't face the facts too well. So far, his and the

>
> I'm still waiting for your's. Like, what amp is legal for 24 to 35
> MHz? And what TV used the 6146?

Aaaaaaaaaaaahhhhhhhhhhh.... out of steam and back to square
one with.

The amplifiers legal for 24 to 35 Mhz, uses TV supplied sweep
tubes which have their grids tied to their plate in AB1 where
significant drive power is consumed. The power supply of said
amplifier has bad news equalization networks across the
rectifiers.
That's how you told us to build it frankie...

> >> Like I said, there is no evidence to support your claim that the tube
> >> is immune from parasitics.
> >
> >Not much more that I would care to do to make you happy. You

> soup since it is impossible to determine that from the information
> that was posted.

A nice motivator to get you out of that dated textbook you repost and
make some observations and tests on your own.

> And not ONCE did I see a post where anyone suggested that grid
> screening or "reduced Cgp" is a reason why grounded-grid amplifiers
> don't require neutralization.

And not once will you see Merlots vs Zins brought up... How
about you join the list and post up a storm frankie..? Most people
on amps generally assume reduced Cgp and Ccp is a good thing,
but not the entire picture. Your word twist game would be a
warm turd on the scene and people would quickly tire of your
same old smell.

> There is a lot of good info in those archives, but those people aren't
> gods that you can take their word on blind faith. As with everything
> else in life you have to verify the facts for yourself. In fact, I

Who asked for blind faith..? You sum it all up in the first line.. "there
is a lot of good info..." It's only a forum... not Mt. Olympus

> have asked you many times to verify my statements, yet you seem to
> think that your own statements are gospel. Maybe you think that
> because you hacked a few amps and subscribed to an amp list that you

You refuse to disclose any actual book material sources, any articles
or text you've written and your a bitter pill read. Your just a fly on
the windshield of life with your behind smashed back up into your
brain. Nothing makes you happy, ever...

> deserve from rrcb the same god-like respect you give those on the
> list. Wrong-o Skippy, especially when you claim you built a BC amp
> with an 8877 that does 10 kW FM! (I should subscribe to that list just
> to post your claim -- now THAT would be fun!)

You have got to be the king of attempted word twist in your babble.
And where exactly did I say I built and 8877 BC amp that does 10 kw
frankie..? Yeah... I didn't think so.

I would enjoy seeing anything you could post that would not be
an attack on anyone else. A review of almost all your posts
indicates that is about all you ever do.

>
> <snip>
> >> >Da' facts are subject to revision,
> >>
> >> There's your problem, Skippy. Your seem to revise your "facts" to suit
> >> your purposes. For example, remember that callsign you emailed me?

> >> issued AFTER the 1997 consolidation, so it was NOT issued as IB and
> >> later 'revised'. You are a liar, Skippy, plain and simple. And I have
> >> proven that 'fact' many times in this conversation. Of course you will
> >> probably 'revise' that fact in your reply...
> >
> >See.... I knew you were going to try cover your fanny by using the
> >FCC web page.
>
> That's stupid. You sent me the callsign with the express purpose of me
> verifying it on the FCC website, and now you are going to claim that
> the FCC is wrong? Well, Skippy, what do you consider to be an
> authoritative reference if not the FCC? Or is the FCC website using
> "dated technology"?

I claim what is on the hard copy paper, not what is on the web.

> > Well bucky... If I scan the actual license image and
> >cover the personal information, are you going to claim I altered
> >the copy..? If you agree, I'll scan the top section of the current
> >License, black out the name and personal information and place it on
> >the web for your review...
>
> Scan it if you want, I couldn't care less. Digital images don't mean
> anything because they are so easy to edit.

That's pretty much how we expected you to respond. Sorry, but
no one here is going to lose any sleep over you sweating the
current IB License I mentioned is not valid as indicated. You
may toss and turn as you please...

> >>
> >> I think nothing more needs to be said.
> >
> >Yeah, you're hiding behind the FCC web page...
>
> That's not 'hiding', Skippy. It's using an authoritative reference to
> verify (or rather, dispute) your 'facts'.

Then make a simple call and ask if the facts as I posted can
be easily verified without the web page. It's an 800 number.

> > which is different
> >from the original actual License hard copy I have. But your going
> >to find a squirming' way to avoid the truth no matter what I do.
>

Hi FM, anybody can inform me what is the activitie of CW in 11mts?,
do u think will be interesting have stations working always CW in our
band? what do u think will be best way for to do? (I mean, QRG for call
and no disturb 555 e.g)
I ask u because a handfull of friends in ham bands are asking me for do
CW in 11mts, and really like I dont like very much ;-) I can't
answered them. Your opinion will be wellcomed.
Thanks in advance

Not sure I follow, but if you are referring to his broken English...look
on down to his division number..it ain't 2 (two), which would be ours.
He is a foreigner, and his post illustrates hammies around the world,
not just in the states, utilize the freeband. If you are referring to
the cw idea, it works just as well as on 10. Showing his concern for
interference to 555, the well known international call channel, well,
all I can say, is I will take these type folks whose "elevators don't go
all the way to the top" over some of the anal retentive hypocritical
lying hammies that attempt to rain their pestilence upon our cb group,
any day of the week.

1905. 7 steps to improve ham radio.

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

Step 2: The passing score for written exams needs to be raised to 90%.

Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

Step 4: Make the no-code license one year non-renewable.

Step 5: Cancel your league membership until they decide to work
to improve things.

Step 6: Complain to the ARRL when-ever you hear an idiot on the air.

Step 7: Turn in rule breakers to the FCC.

Twisted had the option to ignore the inquires, but no he had to squirt gas on the fire instead. Since he wanted to be part of the problem I just let him suffer. I've got no reason to help somebody like that. He made enemies where he originally had little to none, but now seems to have in over flowing abundance. He hasn't learned from his past mistakes, and he definitely isn't learning from his current ones either. As you discovered Twisted's usual mode is distorting the facts, then when found out lie about it. Press him for solid proof of his crazy claims of fact, then sit back and enjoy the circus side-show that develops as he desperately tries to connect a sequence of events with no logical connection between them. When he's done he claims to have proved his point, however nobody else ever seems to believe him.

1922. 20 Steps To Improve CB

Newsgroup: rec.radio.cb
Date: 2002-11-21 00:33:15 UTC
From: A_Real_CB_Operator <cb_ops@limacharlie.com>
Message-ID: <XPVC9.18578$NV.356979@news.direcpc.com>
Source record: 144456

1. MANDATE THE LICENSING OF ALL CB OPERATORS - NO EXCEPTIONS, NO WHINERS, NO CRY-BABIES AND NO MORE PROBLEMS!!

2. ALLOW FM ON CB

3. BAN THE LINEARS!

4. ADD ENCRYPTION / DES / CTCSS / PL / SELCAL

5. INCREASE AM AND FM OUTPUT TO 10 WATTS

6. LCD DISPLAYS INSTEAD OF THE LED CHANNEL /FREQUENCY DISPLAY

7. ENHANCE THE "R.E.A.C.T." NETWORK!!

8. MANDATE REAL CALLSIGNS ---NOT made-up HANDLES!!

9. GET OVER IT AND PUT AN END TO THIS STUPID WAR BETWEEN THE AMATEUR RADIO COMMUNITY AND THE CB COMMUNITY!!!! ARGUMENT IS FUTILE AND POINTLESS!!

10. GO ON A TALK SHOW AND HAVE AN ALL OUT "HOLIER-THAN-THOU WAR" BETWEEN CB'ers AND HAMS!!

11. ENFORCE THE CB RULES AND REGULATIONS!!!

12. PUT CB CHANNEL 9 ON FM FOR REAL CB'ers and replace the CB's in Hwy Patrol Vehicles and Sheriff's Offices with Better Equipment for clear channel comms.

13. STAFF THE FCC WITH CB'ers AND HAMS WHO KNOW RADIO OPERATIONS AND ARE NOT AFRAID TO ENFORCE THE RULES / REGULATIONS ON EITHER BAND!!!

14. CONFRONT CB VIOLATORS WITH AUTHORITIES PRESENT -instead of being a dumbass and getting shot before you can get out of your vehicle to confront the individual in question!!

15. CRY TO WOUFF HONG THAT HIS IDEA WAS REVERBED BY "A REAL CBer"

16. Quit Cryin' to the truckers about your CB!!

17. A "Good-Buddy" is NOT a term referring to one's sexual lifestyle!!

18. "Hand" sounds so stupid when talkin' to another cb'er!!

19. Use RDF equipment to find the jammer or culprit, instead of threats to "kick someone's ass" all the time!! (so pathetic!)

....And Finally

20. Report ALL Activities Consisting Of :
JAMMING
THREATS
SCHEDULED KEY-DOWNS
POSSIBLE BANNED
LINEARS BEING USED!
UNDER_AGED FOLKS
CUSSIN' ON THE RADIO!!
DRINKING AND TALKING
ON THE AIR!!
SOLICITING FOR SEX,
DRUGS, WEAPONS OVER THE AIR!!

There is no software that I know of that lets you use your computer in
place of the real thing, a CB. There is software for what is called
Internet Relay Chat. You log on to various servers and converse, type
messages, in real time to other people.

http://www.irchelp.org/

If you're looking to link CB's by way of computers take a look at the
following links. While the software is not designed for CB use you get
an idea of what would be possible if such software where available.
The software that is available is designed for Ham Radio use only at
this time.

Hans has his meter protected with an input resistor and a couple of schottky diodes across it. You need about 600 volts into it to register 10 over.
;-)

I have read quite a bit of your analysis of the Palomar 225 when searching through Google. Since I
do not have the proper equipment to accurately measure the 225 can you answer a few general
questions:
1. If a CB provides only 2 or 3 watts of dead key input to the Palomar 225 what type of output should
it produce. How about 4 watts of input?
2. If I were to use the Palomar 225 with a 10 meter radio what would be the maximum input power
the Palomar could take and what would be the affect on the output of the Palomar.
3. What is the power output relationship of the low, medium and high settings on the Palomar.

Thanks from a real novice.

Much as I dislike some of the current state of things in amateur radio, we live in the 2000's not the 1950's. We have to deal with the current reality, bad as it might be. Returning to 1952 is not going to cure the problem. We need to pull together as hams and do things without bugging the FCC for everything. We used to do that.

Why not just drop the archaic code requirement, beef up the theory
requirements and get hundreds of new, excited members tomorrow? That'll be
the biggest shot in the arm the hobby has seen in decades.

Just as you think the code requirement may be silly, your attitude
of letting it stop you from getting a ham license is just as
silly. If you want the license learn the code and get it. It is
your lose if you don't.
You can start out with the no-code tech to get into ham radio, and
if you find it worth your time, then learn the code and upgrade.

I would suggest somethig rather different.

Take out the code requirement, and put in the test some DSP questions
(how to make filters, equalize volume, remove noise, and modulate in
phase, frequency, quadrature, etc) as well as more advanced circuit
design.

The code requirement is just silly.
Code is just one of the many ways to encode a signal, a way that
happens to be possible to do by hand. But why bother with it?
That it is useful in emergencies is a ridiculous thing - if your
transceiver works, you might as well talk into it, so also general
SWL, and not only hams, can understand your transmission.
Instead, with the increased ease with which signals are digitized,
DSP should really be required knowledge.
I mean, it takes so little nowadays to feed the signal into an audio
board
or better A/D converter, and then start doing things digitally...

In fact, consider this: DSP should be required because, in case of
emergency, you hook up your PC/laptop audio board to the radio, and
there you go,
modulating any way you want...

Code is what keeps me getting a ham licence.
I just don't suffer fools gladly, and the code requirement is foolish.
If I want to waste time, there are many more pleasant ways to do it.

Cheers!

Peter

Oh and one more thing: I think it is incredibly funny that in a
country where you can get a driver's licence without knowing how to
operate a stick shift, you cannot operate ham without knowing code.

There, now flame me.

You're wrong, of course. If you look at amateur radio from the view of a non-involved historian, the only regulatory change which had a significant statistical impact was the advent of the Novice license back in the early 50's. As originally envisioned and structured, Novice was an incredible smart regulatory move, perhaps the last smart thing the FCC did for the health of the Amateur Radio service.

Other than that, changes in licensing requirements have served only to generate sales of ink, to excite the excitable minority, and to give the Unabashers another reason to cancel their ARRL membership or to buy a life membership. No other impact is evident, and won't be after this current curve in the regulatory road. Hams will still be hams, and the excitable minority will get excited all over again. In about 2012 we'll be awaiting the next "restructuring" plan. Yawn.

Ban everyone who is not 100 percent in accordance with your views . Who the heck would you then post with?

Get real, everyone is entitled to their opinion.

Some where between you and him is probably a reasonable solution. I have noted that of those who got a ticket with little work, many are not renewing. A thing only has value when we have to work for it, unfortunately the ticket no longer requires much effort and has no real value to the recipient.

Still stuck in my mind is sweating before a steely eyed FCC examiner, drawing schematics, sending, and receiving code. Did I enjoy the process? Nope! but I did enjoy being able to count myself among a group of fellow hams that had gone through the "baptism of fire".

I don't care a wit that some folks have 5wpm licenses, You have yours and I have mine. I feel mine is worth more, but that is my opinion. Your mileage may vary...

Allow others to have their opinion, and now that the horse is dead you may cease the use of the whip.

IMHO,
Requiring A/D knowledge is equally as silly as requiring knowing code.
A compromise test of all the various technologies is clearly the logical
way to approach licensing/testing and they attempt to do this to some
degree. But technology is changing rapidly and the wheels turn slowly.
I think we are at a point where a ham should know what A/D means even
if its only picking out the correct words on a multiple choice test.
But hmmm, isn't that basically what the code test is?

Ranting off from a recent thread on r.r.a.a. one would get the
impression that knowing the brand names and specs of current products
(the Hamstick thing) is more important in making a 'good' ham.

The League is pretty much in control of testing and licensing these days
and I'm of the crowd that thinks they are doing everything bass-ackwards

and ultimately alienating radio folks (both new and old) from their organization in favor of whiz-kid technology. I don't desire things to stay quagmired in the 1950's but I don't see the need to overwhelm the bulk of the ham community with articles that are better suited for an IEEE publication. If, back in the 50s, they published *ONLY* SSB stuff, the rank and file membership would have tossed in the ARRL towel...much like the situation we see today. QST is the League for most people and basically it (they) have become nothing more than another modern electronics magazine publisher, not a mouthpiece for amateur radio as a hobby for all age groups.
(Apologies to the CBers and SWLs that I'm cross-posting to)

Great gobs of bovine excrement, the license is simply insufficient motivation for you to learn code. The "suffer fools" nonsense serves only to cover up your lack of motivation. Learning anything is simply one more exercise in broading one's life experiences.

<snip>

We now interrupt this boring thread where ham's bicker yet again about
licensing for a bit of light entertainment.

Community Service

One day a florist goes to a barber for a haircut. After the cut he
asks the barber about his bill. "I am sorry, I cannot accept money
from you I am doing community service this week." The florist is
pleased and leaves the shop.

The next morning when the barber goes to open his shop; there is a
thank you card and a dozen roses waiting at his door.

Later a cop comes in for a haircut and he also goes to pay the
barber, and the barber replies: "I am sorry I cannot accept
money from you. I am doing community service this week." The
cop is happy and leaves the shop.

The next morning the barber goes to open his shop; there is a thank
you card and a dozen donuts waiting at his door.

A Democrat comes for a haircut and when he asks the barber what
he owes, the barber replies: "I am sorry I cannot accept money
from you. I am doing, community service this week." The Democrat
is very happy and leaves.

The next morning when the barber goes to open his shop, a dozen
Democrats are lined up waiting for a free haircut.

A first grade teacher proudly proclaimed to her class one day that she was a liberal Democrat. She asked her students to raise their hands if they were liberal Democrats as well. Not really knowing what a liberal Democrat was, but wanting to be like their teacher, most of their hands flew up into the air. There was, however, one exception. A girl named Lucy had not gone along with the crowd. The teacher asked her why she had decided to be different.

"Because I'm not a liberal Democrat" she replied. ''Then, what are you?'' asked the teacher,

"Why, I'm a proud conservative Republican," boasted the little girl. The teacher, a little perturbed, asked Lucy why she was a conservative Republican.

"Well", she said, "I was brought up to trust in myself instead of relying on an intrusive government to care for me and do all of my thinking. My Dad and Mom taught me these things, and they are both conservative Republicans, and so now I am a conservative Republican too." The teacher, now a little embarrassed and maybe even just a bit angry, said, "That's no reason! What if your Mom was a moron, and your dad was an idiot. What would you be then?" The teacher paused, a bit smug, certain that she'd put the girl in her place, and slowly let a sly smirk creep across her face.

"Well, if that were the case", said Lucy after a moments thought,"then, I suppose I'd be a liberal Democrat."

Chasers are ok mostly. I know a dozen or so.
I spot, which routinely puts me in front of it, which is not the best place to be for visibility, but we're not really interested in chasing along with them so much as defining the track, and reporting damage.

Most of our storms track at 45 degrees to the roads. :-P

Seven nice steps to DESTROY and KILL ham radio. Only several fanatics would stay. How would you like to be re-tested for your driving license every year ? Or to be subject to regular tests from the law codex under the penalty of losing your citizenship ? BTW, do you have a written permission to use the "trademarks" Wouff-Hong, Rettysnitch and Uggerumph ?

God save the hamradio !

I might agree if the theory questions were "fill-in-the-blank" and
"draw-the-schematic", rather than multiple choice - where the answer is
right in front of you. This would help ensure that the person has some
actual knowledge rather than just having memorized a few answers from a
test prep book.

In reality, your proposal would not attract any significant quantity of new
hams because it would make the test harder than it is now. In today's
"instant gratification" mindset world, many people want every thing "now"
and don't want to expend any personal effort to get it. That's why the code
element is constantly being complained about by so many...

You have a great idea. Very creative thoughts. It is too bad in this country now, that too many that matter, and could affect change......don't care! As the late Earl Nightingale said 40 years ago...."Beware of the dangers of apathy". CB isn't alone in the "throw it out with the dishwater mentality". Great idea though.

No, I am considering moving to a 10 meter radio, with a Ham license, and was
wondering what power input range a Palomar 225 can take and still operate
clearly and effectively. I noticed that it is advertised to be used in the
10
meter to 40 meter range which indicates it can take the output of 10 meter
(ham) radios.

>
>
>
>

Hmmm.... this was helpful. Maybe I should have asked whether low means
the use of one sdl446, medium is reduced power to both sdl446 and
high indicates full power to both???

Sure think...the hobby is declining now so let's make it that much harder to
bring people into it.

What an Idiot!

No problem! btw, are YOU volunteering to be part of the VE system that
would have to administer an additional ~70,000 exams-for-renewal per
year? Or is this a "let someone else do the work" idea?
>
> Step 2: The passing score for written exams needs to be raised to 90%.

Again, no problem. But how are you going to convince FCC?
>
> Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

Again, no problem. But how are you going to convince FCC? What new
argument will change their minds after they have been gradually
phasing out code testing for the past 20 years?
>
> Step 4: Make the no-code license one year non-renewable.

Why? And are YOU volunteering to be part of the VE system that would
have to administer the tens of thousands of additional upgrade exams
per year? Or is this a "let someone else do the work" idea?

> Step 5: Cancel your league membership until they decide to work
> to improve things.

Did you read the ARRL's proposal and comments on restructuring? What
should ARRL be doing that they are not doing now?
>
> Step 6: Complain to the ARRL when-ever you hear an idiot on the air.

Why? Enforcement is FCC's job.
>
> Step 7: Turn in rule breakers to the FCC.

How many tapes have you sent to Riley?

Heck, this isn't even a new list! Just a rehash of one from May of
2000. The Troll-O-Meter judges unanimously disqualify it from
consideration due to its nonoriginal content.

>So was mine...

If you check the datasheets for both transistors, you would see that
the resistive part of the input and output impedances of the MRF421
are two to three times LOWER than the MRF455, depending on the
frequency. Your vague statement that "the impedance is low for both
devices" would have been true if you had not qualified your remark by
saying that "the reactance is different per device". The resistance is
also different, and the impedance is -very- different, as per Brian's
observations.

If you had ANY experience with amps you would know that it's common
practice to slightly bend the armatures so that the contacts for the
output circuit make contact before, and are released after, the
contacts for the input circuit (a practice called "sequencing the

relay"). That way there is no power going through the relay when the output contacts are switched. This has been done not only with RF amps, but has also been used in tranceivers since their invention. Schematics don't usually indicate when a relay operates in this way, so it's a practice you probably won't learn by hacking amps from schematics found on the internet (which explains why you didn't know about it).

And the real issue with the relay in that amp is the fact that there is only one for both the input and output. If there is one thing that Pride got right with their 100 is their use of seperate input and output relays.

Source record: 144574

>and was
>wondering what power input range a Palomar 225 can take and still operate
>clearly and effectively.

it can take as much power as it can while still modulating forward on AM. if your backswinging on your power meter while talking then you are over driving it and probably sound bad. it doesnt take more than a couple watts to over drive it. it can handle a stock 10 meter radios sideband signal no problem but the AM would have to be turned down and remember no swong mods while running a box

>Hmmm.... this was helpful. Maybe I should have asked whether low means
>the use of one sdl446, medium is reduced power to both sdl446 and
>high indicates full power to both???

there both running switching to low just kicks in a resistor to pad the imput to the finals so it see's less drive. it

1990. Bring back The CB license

Newsgroup: rec.radio.cb
Date: 2002-11-21 14:07:55 UTC
From: crossfire <noone@home.com>
Message-ID: <1037887879.63565@nnrp2.phx1.gblx.net>
Source record: 144576

Seeing how there are so many CBers using Freeband , 10mtrs and 12 mtrs . The FCC should implement a CB+ license whereas the applicant is required to take a electronic theory test , a procedures test , and a rf exposure test .
Upon successful completion of this exam Give them from 27.500 mhz to 28.000 mhz and 25.000 mhz to 26.500 mhz.
Not only would this be a good introduction to ham radio , It would also give Them the power to police Their own bands and have some recourse against quarmers and CB misfits .
As for 11 mtrs , Let em have it . A CB plus license would set a whole new standard amongst CBers that honestly want to have decent and meaningful conversations on the air.
73" and keep it real.

>Your statement only...

Yes it is. It's a conclusion based on education and practical
experience. However, if you would like to prove it to yourself, go
visit your 8877 FM transmitter and unload the tank.

>> <snip>
>> >The text was posted using information based on actual examples.

How did you verify it? Did you actually unload an 8877 from the tank
and it didn't flash over? I doubt it.

>Like your adding rectifier equalizing networks mistake. Mfgrs
>updated their products and posted data sheets for the newer
>devices.

Point to one of those rectifier data sheets that 'updates' the need
for voltage equalization in series rectification.

>well designed and constructed, which does not require
>conventional parasitic supresors for common HF and VHF
>operation. That tube is the 8877 and some of its cousins.
>
>We are not talking generic amplifiers which can be made
>to oscillate.

The 8877 is a very well-designed coaxial-type tube that is capable of
operation well into the GHz region. As with any other tube, if there
is no parasitic supression, any lead from the plate to the tank input
capacitor is going to act like a radiator. If there is enough
inductive or capacitive coupling between that line and any resonant
condition in the input circuit, the amp will oscillate, and it will do
so at the frequency of the resonance being excited by the plate lead.
Now because of the high operating frequency possible with that tube,
combined with the ease of unintentionally creating UHF resonant
conditions in just about any circuit, and the fact that such short
wavelengths can sneak through chassis holes and even mesh screens, it
would be plain foolish to not include even just a low-Q supressor at
the plate.

You should have gotten a clue from reading the thread where someone
built an amp with the 813 and left off the parasitic supressor because
the VHF gain of the tube is poor. What happened? He got parasitics in
the low VHF range and nuked his tube.

>Now you want to imply that I say it is only the tube or the
>anode circuit... don't play games franklin.
>Your bob and weave trying very hard to say that I restricted
>specific parasitic sources to one cause.

I don't think even YOU know what you said -- you were too confused as
to the difference between neutralization and parasitic supression!

>You present any source material or text directly related to the
>subject.... and we'll go over it. Otherwise, your still just
>chasing windmills with your bitter pill poopy attitude.

No, we won't go over it, because no matter what I produce you will
call it "dated" regardless of it's validity. That is why I am now
relying on the logical application of basic electronic principles, an
example of which is my above explanation on parasitics. You can beg
for source material all you want, but if you can't logically dispute
what I wrote above then no other source is needed.

>many learn how to filter all the material to arrive at a logical mean.
>
>Aside from the above, I believe a lot of what is specifically referred
>to on that page is possibly sourced to both the applied circuits and
>some well known issues with 8877 tube production.

Let's see now... Someone claims, against all electronic fundamentals,
that some tube doesn't need parasitic supression. But when amps are
built without supressors and the tubes start melting, the logical

conclusion is that it must be a production issue. Makes perfect sense
to me... not.

>The more recent 8877 conversion example by John does not
>have the traditional shortcomings found in previous examples,
>the end result is that his amplifier is stable without parasitic
>supressors installed.

Good for him. Like I said, it ain't my money.

>> >Nice try to side step... but you trip over your own feet.
>>
>> What am I tripping over? Your explanation of why some tubes are prone
>> to parasitics? I can't trip over it because you haven't provided it!
>
>Simple, internal values of C and L and the tube geometry.

Those are only contributing factors to only one cause of parasitic
oscillations. The short internal leads will indeed prevent the tube
from self-oscillation at microwave freqs, but certainly don't prevent
feedback and resonant conditions in the amplifier circuit. You are the
one that's tripping, Skippy.

>> <snip>
>> >> http://www.cpii.com/eimac/sec2-2.htm

Only from your perspective, Skippy. It must come from people like you
telling me that I'm dumb, stupid, ignorant, and that I should get busy
eating my "crow sandwich".

>Why don't you step up to the plate, join the list server and post the
>question yourself..? Just drop the amp gods baggage at the door so
>people will even talk to you.

I might just join it anyway. But the "amp gods baggage" is your's,
Skippy -- I don't take their word as "gospel".

>Come on Mr. big shot, you've got the big mouth via your keyboard.
>Time to step up and do some things for yourself for a change. You
>can also ask about the rectifier equalization networks you love
>and the reasons why grids are not tied to the plate in RF amplifiers.

I'm not the one disputing commonly accepted electronics practices. You
are. Ask the questions yourself. It would be a wonderful way to verify
your facts and dispute mine. Or don't you have enough confidence in
your own 'facts' to accept such a challenge?

>> >Cute twist of words in your above post.

>get the impression you live to repost text book information which
>has proven to contain errors and dated material

Holy bovine excrement, Batman! You mean that every electronic engineer
that has graduated from an institution of higher education was taught
the wrong information -- scientific and mathematical foundations for
principles and practices that have withstood the test of time in both
experimentation and practice by both students and professionals,
provided by the most reputable sources in the field of electronics and

engineering, having credentials you will NEVER match -- and that YOU
have a better handle on the facts than they do?

You have a definite ego problem, Skippy!

> and that your
>not willing to resource anything further than a mouse click in
>your narrow little world.

What I have referenced you have discarded as being "dated" without
even knowing the date of the reference.

These cautions don't "abound" in the referenced material. If such
cautions were so common, why were they not included in the material
provided by Eimac?

> If you would ever care to reference the original source
>material (which contains the mentioned cautions), try the
>SAI Radio Handbook, 18th edition... around pages 180. He
>was an Eimac Engineer, probably one of the ones sourcing
>some or much of the material in the Care and Feeding book

>your dancing about via the CPI web page.

Yet the "Care and Feeding" book does not contain these 'cautions'. If
your SAI reference contains such a caution, quote it.

>The statement remains as fact... nanny nanny boo boo to you..!

Your 'fact' is unsupported. The 'fact' is that the 4CX250 was intended
for use as a tetrode, not a kludged triode, in which service I'm sure
it has many issues.

.... "nanny nanny boo boo"?

>> >> Also notice that Eimac DOESN'T make sweep tubes.
>> >

>> the 8877 is immune to parasitics!"
>
>Did you bother to look for/at the credentials of the author of that
>text Mr. library..? Enjoy another crow sandwich.

Go ahead and post those credentials if you like.

Speaking of credentials, do you remember my quote that describes the
operation of the grounded-grid amplifier? which included the reason
why it doesn't require neutralization (because it's a non-inverting
amp)? Well, that book was written several years ago by Robert Schrader
W6BNB, former Chairman of Electronics at Laney College. Contributions
were also provided from ITT, RCA, Hallicrafters, Donald Middleton
(former Professor of Electronics, Southern Colorado State College),
Edwin Pollock W6KHS (formerly of Cabrillo College), and Oliver Ruel
(formerly of Ranken Technical Institute). The book was proofed by
professionals from both the radio/electronics field and the academic
community, as well as by the publisher McGraw-Hill (which I'm sure you
are aware is probably the largest publisher of electronics literature
in the world). That book was used for many years by dozens -- if not
hundreds -- of colleges and universities around the world, the
students of which went on to become very successful in their fields.
Matter of fact, I'm sure even some of your amp gods used this book,
and a few may still have a copy.

But YOU, in your internet-educated wisdom, just tossed the quote out
of the window under your catch-all excuse that it's "dated".

>>
>> >> >I feel pretty safe agreeing with him and my books, you keep
>> >> >your incomplete dated text book opinion for yourself.
>> >>
>> >> I don't agree with anyone until I can verify the facts for myself.

Truth does. You don't.

>> deserve from rrcb the same god-like respect you give those on the
>> list. Wrong-o Skippy, especially when you claim you built a BC amp
>> with an 8877 that does 10 kW FM! (I should subscribe to that list just
>> to post your claim -- now THAT would be fun!)
>
>You have got to be the king of attempted word twist in your babble.
>And where exactly did I say I built and 8877 BC amp that does 10 kw
>frankie..? Yeah... I didn't think so.

Quite right, I thought you were referring to your other BC station.
But there is nothing except your word that the station uses the 8877,
or that you had any part of that station or any other station -- and
your word means nothing after your "IB license" claim. But then you
probably suppose we should all take your word as "gospel"...

>I would enjoy seeing anything you could post that would not be
>an attack on anyone else. A review of almost all your posts
>indicates that is about all you ever do.

I do enjoy exposing RF voodoo in all forms, but I have also provided
plenty of constructive contributions to this forum. Your problem is
that you are so focused on defending your bogus technology that you
haven't noticed.

>>
>> <snip>
>> >> >Da' facts are subject to revision,
>> >>
>> >> There's your problem, Skippy. Your seem to revise your "facts" to suit
>> >> your purposes. For example, remember that callsign you emailed me?
>> >> Well, it is listed as IG, not IB as you claimed. And the license was
>> >> issued AFTER the 1997 consolidation, so it was NOT issued as IB and
>> >> later 'revised'. You are a liar, Skippy, plain and simple. And I have
>> >> proven that 'fact' many times in this conversation. Of course you will

>> >> probably 'revise' that fact in your reply...
>> >
>> >See.... I knew you were going to try cover your fanny by using the
>> >FCC web page.
>>
>> That's stupid. You sent me the callsign with the express purpose of me
>> verifying it on the FCC website, and now you are going to claim that
>> the FCC is wrong? Well, Skippy, what do you consider to be an
>> authoritative reference if not the FCC? Or is the FCC website using
>> "dated technology"?
>
>I claim what is on the hard copy paper, not what is on the web.

You claimed it was a valid license for the IB service, a service which doesn't exist. Even if some old lady typed out IB on the license out of habit, it still doesn't negate the fact that the said license is, and has always been, for the IG service. It also doesn't change the fact that the IB service no longer exists, which you knew because you have licenses yourself that are for the IG service that would have otherwise been for the IB service. You just keep compounding your lies, Skippy.

>> > Well bucky... If I scan the actual license image and
>> >cover the personal information, are you going to claim I altered
>> >the copy..? If you agree, I'll scan the top section of the current
>> >License, black out the name and personal information and place it on
>> >the web for your review...
>>
>> Scan it if you want, I couldn't care less. Digital images don't mean
>> anything because they are so easy to edit.
>
>That's pretty much how we expected you to respond. Sorry, but
>no one here is going to lose any sleep over you sweating the
>current IB License I mentioned is not valid as indicated. You
>may toss and turn as you please...

Make all the excuses you want, Skippy. You made a claim, you failed to prove your claim, and all the evidence contradicts your claim. That's the same thing that happens with almost all your claims, Skippy. Are you beginning to see a pattern here?

>> >>
>> >> I think nothing more needs to be said.
>> >
>> >Yeah, you're hiding behind the FCC web page...
>>
>> That's not 'hiding', Skippy. It's using an authoritative reference to
>> verify (or rather, dispute) your 'facts'.
>
>Then make a simple call and ask if the facts as I posted can
>be easily verified without the web page. It's an 800 number.

Do your own homework, Skippy. You have a telephone, don't you? Call it
yourself and find out. If it can be verified through the phone number
(assuming it's an FCC phone number), verify your own facts. If they
can be verified through that number THEN post the number.

>> > which is different
>> >from the original actual License hard copy I have. But your going
>> >to find a squirming' way to avoid the truth no matter what I do.
>>
>> And you are going to say anything you can to defend your lies.

Why not just get a ham license? Then you can play with a whole lot
more spectrum, a whole lot more power, and a bunch more operating
modes. The test is easy when they give you the answers. Wan't HF but
are too lazy to learn 5 WPM? Just wait a year or so until they drop
the code requirement.

: Hmmm.... this was helpful.

Glad it was.

Maybe I should have asked whether low means
: the use of one sdl446, medium is reduced power to both sdl446 and
: high indicates full power to both???

The switches add resistance to limit the input power, normally.

No, not really.

I looked at the Galaxy 10 meter line and saw ranges of output on AM from 8
watts to
50 watts. Given that wide range I would guess that the output of the 10
meter radio would have to be limited so that the amp is not driven to
distortion.

: No, not really.
:
: I looked at the Galaxy 10 meter line

Galaxy? those radios are on the banned transciever list, why would a Ham
want to use a radio that is targeted at the CB market ? echo, roger beep on
10 meters. reading you post further answers that question.

:and saw ranges of output on AM from 8 watts to 50 watts.

I don't believe there is any of those radios that does 8 watts and another
50 watts on am I think you may be confusing RMS with peak reading, unless
you are talking baout a radio with a built in amplifier.

:Given that wide range I would guess that the output of the 10 meter radio
would have to be
: limited so that the amp is not driven to distortion.

Hmmm, distortion driven? more importantly you don't use AM on 10 meters. I
think perhaps you may have other motives. Just my opinion based on what you
have said. If it was for ham use a few things clearly jump out, your lack of
concern for SSB or CW. Your concern also with distortion again leads me to
beleieve Am only, which means to me your going to go Cbing. Your concern
with deadkey power has no relevance on ham since SSB, CW, FM is the modus
operandi. which Galaxy did you have in mind the one with the Rebel Flag?

Great idea....but it would cost money. That's a huge part of the demise of the license originally. Same in the broadcast business, where a 3rd class license was required years ago. It is now gone too. And...down the slippery slope we continue.

If you really want to increase the Ham ranks, and improve people's knowledge
and skill at the same time...

Have a monthly operating contest where the winner gets $5000.
Have a monthly design contest where the best project gets $5000.

After winning, you would have to sit out for 2 years so others could
benefit.
The FCC could fund this using the revenue from the spectrum of ours that
they're selling to the cellular crowd and other big lobbies ;-)

>
Hmmm.... I had a license with code requirements (many years ago), but I also
have problems with certain kinds of motor skills. It isn't impossible, but I do tend
to find the competency of 100W+ CBers who happen to have ham licenses to
be disappointing.

My biggest frustration now is the use of SOT type packages for my RF design, but
I am working through the issues, and learning how to deal with the technical problems.
I suspect that much of the ham hobby is being supressed by the commonly available
parts technology (and at UHF+, the needed smaller dimensions.) However, from a
time and 'exclusive club' standpoint, I suggest that the competency of 95% of the hams
would be quite insufficient to build and fully understand their equipment.

This is akin to a brutish physical skill overwhelming intellectual comptency. Morse
code is only a brutish, anachronistic (most of the time) skill (which is problematical
WRT poor fine motor control.) It is apparent that some in the ham community
are compensating for lack of sufficient mental skills by making it exclusionary based upon
physical skills.

The amazing thing is the dumbing down of ham radio (but the rigs are beautiful
nowadays aren't they?) Ham radio is now almost an endorsement on CB, rather
than having to REALLY know (not just remember) something appropriate for
the current world.

Think about it :
A lot of CBers already have radios that will go there and if You charge 10 or 15 bucks to take the test , The fcc makes money , They will also save money because they wouldn't have to pay agents to go to truck stops to look for illegal radios .
After all The ARRL has been trying to figure out how to get more people into the hobby so that they don't lose their operating frequency's to the wireless communication industry .
What better way to give FCC an economic boost than to tap into the wealth of the CBers?

Dave, I wanted to thank you again for your replies. I see that this group is really not the place to have an intelligent conversation. Guess you can see why I used an ann. server to post. Shoulda figured there would be a bunch of Ch 19 people hanging around waiting to start shit with the first victim to come along. Kinda too bad that humans don't eat their young.

Again, thanks for the input and I'll be sure to drop back by when I find the solution to this one. Though on second thought, why contribute to a group of Ch 19 type idiots anyway.

Take care ......

Not trying to be argumentive, but if the operators are, indeed, operating
illegally now, what's to ensure they operate legally just because there
suddenly was a new requirement? Then there's
the matter of NTIA, the gov't agency that controls most of that spectrum
within the USA. Whether
we are using it in a "certain" way, we DO have certain agreements in place
with other nations. I know of at least one military group that does use its
26 MHZ frequencies and USAF would not be
happy to have to compete with more QRM that it does now. The simple truth
is, it won't happen
for two basic reasons--and it is not me trying to be a smarty pants. 1)
The FCC is NOT the DO all, BE all of spectrum management in the USA; IOW,
they can't just wave some magic wand and
make it so. They are subordinate to NTIA, at least to the extent that if
they happen to butt heads
with them, they most often lose. 2) CB Radio, according to its official
FCC definition, is NOT supposed to be a hobby. Yes, it has become a hobby
contrary to what its planners had hoped, and
it has become a substitute for ham radio for whatever reasons (can't, won't
master the code, no test
to take, etc)--all contrary to every intent and purpose attributed to it.

As long as there is an Amateur Radio, CB Radio will not get any more "concessions", rules relaxations, or changes in its "official" structure to facilitate its being a parallel service; it just isn't gonna happen. The reasoning is, simply, that CB was for short ranged, personal or business comms, and ham radio was for DX-ing and experimenting, and there is no NEED for CB to be able to communicate, for example, over 155 miles. Sure, it can, but just because you hear skip doesn't mean you must cultivate it. That is the way it is regarded in official circles.

If additional "space" is created for Citizens' Radio, I would just about bet it won't be anywhere near 11 meters. More likely, up on and near MURS and GMRS as more and more commercial ser-vices go to 900+ MHZ. To the spectrum managers, this cures one of their problems: getting more and more people onto a given frequency without interference. VHF/UHF can do that whereas 11 meters becomes a jumble of racket and squeals. A CB license that offers "privileges" outside the regular 40? Nah, ain't a-gonna happen.

You got a current mfgr that suggests inclusion of resistors and
caps in a current generation of common rectifier diode strings
found in rf amplifiers.? Say the 1N5408 as an example..?

> capacitor is going to act like a radiator. If there is enough

Notice the "IF" statement. Keep in mind terms like shielding,
isolation and good design/contruction practices to remove "IF"
from the equation.

> inductive or capacitive coupling between that line and any resonant
> condition in the input circuit, the amp will oscillate, and it will do
> so at the frequency of the resonance being excited by the plate lead.

There is no "IF" in the example conversion 8877 amplifier described
on the list server. It is stable without anode lead parasitic
supressors.

> Now because of the high operating frequency possible with that tube,
> combined with the ease of unintentionally creating UHF resonant
> conditions in just about any circuit, and the fact that such short
> wavelengths can sneak through chassis holes and even mesh screens, it
> would be plain foolish to not include even just a low-Q supressor at
> the plate.

"Sneak"..? Foolish in your opinion which carries little weight
in this news group or the amps forum. The mentioned 8877 amplifier
works well, is stable and the reasons for said are described
on the list server. Your opinion is contrary to those of at
least three well known leading edge Engineers and/or Authors working
in the industry. You lose...

> You should have gotten a clue from reading the thread where someone
> built an amp with the 813 and left off the parasitic supressor because
> the VHF gain of the tube is poor. What happened? He got parasitics in
> the low VHF range and nuked his tube.

Nice off topic try... We are and were talking about the design
and construction of the 8877 and the reasons why it is stable in a
well built circuit, without anode suppression.

>
> >Now you want to imply that I say it is only the tube or the

> conclusion is that it must be a production issue. Makes perfect sense
> to me... not.

Possibly one issue of a larger picture, but not given as the only one.
When all your previously mentioned "ifs" are out of the mix, an 8877
built as described in the example is stable without anode parasitic
supressor(s). It's that simple...

> >The more recent 8877 conversion example by John does not
> >have the traditional shortcomings found in previous examples,
> >the end result is that his amplifier is stable without parasitic
> >supressors installed.
>
> Good for him. Like I said, it ain't my money.

ZZZZZZZZZZZzzzzzzzzzzzzzzzz.........

> feedback and resonant conditions in the amplifier circuit. You are the
> one that's tripping, Skippy.

You make my point... only contributing factors of a larger picture.
Each tube has different values... the 8877 values are dealt a good
card by design.

> >Old information, no one claims it's inaccurate. Are you trying to
> >make some technical point..?
>
> It doesn't make any difference if the information is old or new as

> >
> >So what about the above is not a fact..?
>
> The Cgp doesn't change -- the EFFECTIVE Cgp changes.

Depends on who's book you read, but I have no problem with the use
of effective. Less Cgp is part of the larger picture... where as
the typical grounded grid amplifier does away with neutralization.

> >> screen grid is effectively grounded (unvarying DC potential) in a
> >> common-cathode amplifier as well, which changes the EFFECTIVE Cgp

> >boat...
>
> Both of your reasons were addressed below.

Not as I mentioned it above, I did not say that a grounded screen is the
only reason common g-grid amps do not require neutralization. Your
smoke

screen avoidance of the issue here.

> >> > The technical point that needs to be
> >> >made is less Cgp
> >>
> >> The Cgp of a TUBE is reduced when you ADD a screen grid TO A TRIODE.
> >
> >And...?
>

> your facts and dispute mine. Or don't you have enough confidence in
> your own 'facts' to accept such a challenge?

I know of no commonly accepted practice of placing grids to plates in
RF amplifiers... maybe you could point out EVEN ONE example. Let

me rephrase that... EVEN ONE WORKING EXAMPLE...?

If you examine most of the current generation / production amplifiers,
you (or most everyone else with their eyes open) will probably
notice the lack of equalization networks on the rectifiers. ITS
NOW COMMON TO OMIT THEM as they are not required. ie dated technology.

> >> >Cute twist of words in your above post.

news:i92dnZvYT7B2qkagXTWcog@comcast.com...
LOL Nad, It is quite simple what happened someone forged the initial twisty posts, some guys emails Twisty, he then thinks you have something to do with it he then gives out your phone number as a form of retaliation. Then he tries to lie and cover it up LOl
==========
>Twisted had the option to ignore the inquires,<

Ignore the inquiries? Nah..as I claimed many time before,,I believe in returning thisg to their rightful owner...even if some of them don't want it returned.

> but no he had to squirt gas on the fire instead.<

Your fire. If you couldn't take the heat, you shouldn't have been caught playing with matches.

>Since he wanted to be part of the problem I >just let him suffer.

Excuse me, lelnad,,not for myself, you see,,,but for the contingency..when exactly was it that I,...,um.."suffered"?

>I've got no reason to help somebody like that.<

Lelnad, you couldn't help if you tried.
Besides, it was I that helped you. I proofed your bio a few years ago and edited it at no charge.. This was right after you claimed it served as a resume, remember? I still have the unedited version in a folder somewhere...I'm a real packrat..keep everything..anyways, this "resume" wouldn't have got you hired in a junkyard before your errors were corrected. But, I'm like that, I don't hold a grudge...see, if you still claim your page serves as a resume, you need get rid of the word "got" in the body. Educated employers not only expect but demand more from tech college grads.

>He made enemies where he originally had >little to none, but now seems to have in over >flowing abundance.

Yea? S' funny.....I've had nothing but invites and get togethers with regs in here...oh, you mean YOU and Frank and a few other dogpile members? Gee, lelnad,,,it's not my alleged friends running around referring to me as "Nad".

>He hasn't learned from his past mistakes,<

Who was supposed to have "taught" me anything, Lelnad? There are several in here that have taught me many things, but unfortunately, you were never able to manage to pull yourself up to that level of knowledge and etiquette.

> and he definitely isn't learning from his current >ones either.

Why don't you attempt to enlighten us with more of your guffaws?

> As you discovered Twisted's usual mode is >distorting the facts, then when found out lie >about it.

Never attack a claim..just be vague and ramble on, Nad. You wear it oh so well.

> Press him for solid proof of his crazy claims of >fact, then sit back and enjoy the circus >side-show that develops as he desperately >tries to connect a sequence of events with no >logical connection between them.

An example of my claims would be what, Lelnad? You were smacked down long ago, several times for your insolence. One would think you would get over it after al this time, but it's clear you are not a sane nor rationale individual. You are what plagues hammie radio.....the bottom of the bottom. You are not part of the solution, you are part of the problem.

>When he's done he claims to have proved his >point, however nobody else ever seems to >believe him.

I know your self-esteem is at an all time low right now, Lelnad, but I have NEVER referred to you as "nobody". Chin up, old chap..things will get better.

The amazing thing is the dumbing down of ham radio (but the rigs are
beautiful
nowadays aren't they?) Ham radio is now almost an endorsement on CB,
rather
than having to REALLY know (not just remember) something appropriate for
the current world.

John

At this point I was looking at 10 meter band radios on a website and noticed their power ratings. These Galaxy radios were NOT on the banned list. I think you are asking me if I know that AM is or is not used for HAM and I do not know. From your answer I can assume AM is NOT used for HAM.

Relax, I probably don't know enough to understand that AM is not used on HAM. I looked at 1stopelectronics.com, chose the 10 meter radios and ASSUMED that AM was used for HAM.

I do not intend to go CB'ing with these radios I just thought that if I get a HAM license these might be the next set of radios to purchase.

Live and learn.

Isn't it a real paradox? The smarter and more beautiful the radios, the
dumber the hams who use them! :-)

Ham radio is now almost an endorsement on CB, rather
> than having to REALLY know (not just remember) something appropriate for
> the current world.

I certainly have no problem agreeing with this, although it really has
little or nothing to do with Morse code on ham radio. You can always use
a keyboard to send if you can't physically handle a manual key or
paddle. I may go to one of those due to arthiritis myself one of those
days. But a computer program does a really poor job of copying, as far
as any I;ve been able to evaluate shows. That will probably change if
some of you more computer literate souls choose to keep working on it.
Looks like you'd rather just dump the whole mode. That I don't
understand. I do understand why some people don't like th emode, and I
can appreciate that. There are things I don't like, too. I have no great
love for Morse code(despite the rantings of some of the more rabid
anticoders who post here), but I learned to respect it for what it is
and appreciate it for what it offers-the most basic, simple, easily
implemented mode of radiocommunications yet devised.

Does that mean I or any other CW supporter would in any way advocate
use of CW -at any time- to the exclusion of better more efficient modes?
Of course not, again despite the rumblings of some anticoders posting
here. I, and most other code supporters, routinely use advanced digital
modes, some of us use them more than CW. Again, that does nothing
whatever to diminish the qualities of Morse code. Some of us understand
the mode well enough to consider it to be a valuable asset to ham radio.
If you don't, that's certainly your privilege.

Dick

No If you want to buy a Ham radio buy it from a reputable Ham dealer. Not a
Illegal Storefront for Amp makers which is exactly what Onestopelectronics
is. They are a front for the Xforce line of amps. In fact Carriage
Car@aol.com wash who used to post here has become one of the owners.
Amazing the info you find out in these CB forums LOL

:
: Live and learn.

Exactly, the way made it sounds is you may be a ham and want to use am on 10
meters. Buy a real ham radio not a Illegally marked Export radio

Here's what I'd like to see happen with the "CB" band. With the technology we have today, I'd like to see everyone get their license again. Built into every radio (and non-modifiable) should be a unit which broadcasts your call sign with each key. Not audible to us, maybe on a different frequency or very high beyond our ear's ability to hear. simple computers could pick up the codes, record the transmission, and store them for a short period of time, then without complaints...they could be overwritten. If these are programs are installed in every branch of the FCC, there would be no need for additional personnel and thus a lot of extra money to run this type of program. The FCC could set up a toll free number for complaints and they could monitior the records from that area and take care of the problem person. This is a light outline of my idea, odviously some things might need to be tweaked or adjusted to make it feasable. I think this would help weed out the idiots and restore some decency to the CB. Since you wouldn't be able to modify or disconnect your call sign transmiter, you'd be forced to be good. Any comments?

David

I don't care if the general population can understand me. They can't
talk to me, so whats the point?

> Instead, with the increased ease with which signals are digitized,
> DSP should really be required knowledge.

I know plenty enough to be able to use DSP. I have DSP built into my
radio, and I have it outboard on my computer. Most of my PSK-SSTV,
etc, etc programs also use DSP. Big deal...

> I mean, it takes so little nowadays to feed the signal into an audio

> or better A/D converter, and then start doing things digitally...

You said it... So what makes it so special?
>
> In fact, consider this: DSP should be required because, in case of
> emergency, you hook up your PC/laptop audio board to the radio, and
> there you go,
> modulating any way you want...

I can train a smart monkey to do that. But overall we have a problem..
If I have an emergency, can I call you to come over to the scene and
bring a laptop? I have a radio in my car, but no laptop yet. Of
course, I could talk into the mike, or use a code key, but I want to
be stylish like you. Hummmm, you say you live many states away? Take 5
days for the laptop to get to my accident scene via UPS? Oh well...
I've still got my hand to keep me company in the meantime...

> Code is what keeps me getting a ham licence.

Why? Are you "gifted" or something?

> I just don't suffer fools gladly, and the code requirement is foolish.
> If I want to waste time, there are many more pleasant ways to do it.

Well, ok then. A man's got to know his limitations...

>
> Oh and one more thing: I think it is incredibly funny that in a
> country where you can get a driver's licence without knowing how to
> operate a stick shift, you cannot operate ham without knowing code.

What does a country have to do with this? It's international treaty.
BTW, in this state, the car you take into the driving test will
determine if you need to know how to manual shift or not. If it has a
manual transmission and you can't shift it well enough to drive, you
won't get a license. You will have to buy a new car with an automatic,
and retake the test. Expensive way to get a drivers license if you ask
me...

>
> There, now flame me.

Naw...Just pity...Anyone that lets a snail slow 5 wpm code test stand
in their way, doesn't really want a ticket too bad. What does it take
to learn? All of two weeks? Good grief...How long did it take you to
learn all about DSP?

Next.... MK

2043. Re: 7 steps to improve ham radio.

Oh I am quite willing to learn things in general!
But the point is, there are so many things to learn,
and I prefer to learn useful things to useless ones.
I'd rather spend time learning more about DSP, that can
be useful to me to post-process radio signals, than code,
that I am likely to never use.

And another poster commented that I simply not motivated enough
by amateur radio to learn code.
True, by definition.
I sometimes listen to what hams talk about; 95% of the time
they talk about their radio setup.
The idea of having to learn code, get a licence, and build an
antenna, to be able to talk about my radio on the air
is ... uh ... less than overwhelmingly enticing.

I predict that, with all the new technologies available now
(cellphones, internet, computers, etc etc), amateur radio will
simply die out for lack of interest; the ARRL and others are
doing a pityful job of getting the newer generations involved.
Too bad, because some things going on with packet radio,
computers, routing etc are incredibly cool.

They keep up this old-fashioned requirements, and they don't
realise that, as the younger people are turned off,
their radios will also eventually be turned off, when FCC
reclaims the frequencies.
They see the refusal of somebody to learn code as that person's
problem, and they don't realise that the lack of membership will
soon be their problem.

Sooner or later the FCC is going to reclaim those frequencies
due to lack of interest, and nobody in the US consituency will care,
except the 0.0001% of the population - hardly a political constituency.
Come on - listen to the actual _content_ of ham conversations:
if SW bandwidth ever becomes valuable, I don't think ARRL has a chance
to argue that there is something worthy going on there.
And the original purpose, to spread the knowledge of radio technology,
is moot now - with so many other important technologies, why would
one worry so much about radio?

Many hams are now in their 50s. I predict that by the time they are
dead, in about 25 years, amateur radio will also be dead, reduced to
a small number of frequencies used for emergency communication.
All the rest will be commercial bandwidth.

I have 3x Tait T2020 radios for sale on Ebay.

The details are:-

3x Tait T2020 Radio's. 1x 68-88 Mhz WB, 1x 148-174Mhz NB, 1x 450-520Mhz WB.
25 watt, 100 channels. Including speakers, microphones, mounting cradles &
power leads. Also includes programming lead & program on floppy disk.
Selcall module installed into 68-88Mhz version.
All units in very good condition & have been verified working.

Link:-

MMM ... you forgot Item 8: as part of all amateur radio license exams,
examinees must demonstrate the ability to solve the differential equations
from which impedance formulae and the like are derived!

: that I am likely to never use.

Peter,

That's great news. You should know that you can get involved hip-deep in amateur radio, including DSP (pre- and post-process) without learning a single dit of Morse code. Just take the written exam, Element 2, and you'll be licensed to experiment on literally many GHz of really prime spectrum.

We'll be looking for you to join us soon. I'll bet you can teach us a thing or two.

Galaxy 10 meter line
Joigey wrote:
>Galaxy? those radios are on the banned >transciever list,

Some hams can use them on 10.

>No actually they can't twisty, didn't jerry >explain this to you ? If
not Jerry you got's
>some splannin to do.

Yes, they can, and Jerry never claimed hammies couldn't use a Galaxy
radio legally on 10,,,he knows they are legal for use in that manner.

>why would a Ham want to use a radio that is >targeted at the CB market
?

So he could play cb and freeband. Plus, depending on the Galaxy, he can
get a roger beep and echo...you know, for all them times he wants to
come down to the cb channels.

>Which is of course Illegal. Right?<

Who was talking legalities? Some of you have this one track mind
obsessing on law and rules while breaking them all....never saw so many
power-hungry power trippers gathered in one place all at one
time...pretty cool trick, this thing we got going on with cb.

>echo, roger beep on 10 meters. <

No..for the freeband and cb and usually only on AM.

>Exactly not for Ham use see we at least agree >on his motive

But the clipped clarifiers and frequency counters sure as heck aren't
made for cb.

>I don't believe there is any of those radios that >does 8 watts

Many of them do that and above.

>Again you snip what I said and pulled that out >of context.

I didn't snip anything, George. I addressed all of your post and omitted
nothing.

>I can do it too Twisty<

Yea, but that isn't conducive to any point you may be trying to make.
That type behavior ruined a few mad-hammers in here.

>and another 50 watts on am<

Is that in Birds

>I am not sure perhaps it is<

Oh, I see...you snipped my emoticon (<g>) dictating I was grinning..ok.

>in One flew over the cuckoos nest you may >have to ask Tom.

Was he in the flick?

Let me explain: it is an unnecessary and anachronistic barrier to entry. Frankly,
'the code' was really a prominent mode of operation at one time, but now it is
mostly a barrier to entry. It is MUCH MORE useful to center ham radio on
creative endeavors (which can also include working long distance in poor
conditions with code.) I am NOT anti-code, but I am anti-code exclusivity.

There really needs to be a basic ham license w/o code. To work at all in the
'code' bands, you'll need to pass the code test (similar to the good old reserved
bands for extra.) To be able to work anything but phone in limited bands,
you'll need the higher technical endorsements. So, there would be the
basic general ham license, which only provides limited communicator 2M,3/4M band

permissions. After that, for the real traditional 'u build it' ham stuff, then your technical endorsement would give you access to all but the code bands. There might even be multiple levels of technical endorsement (e.g. HF, UHF.) For the code bands, there would be the <10wpm bands and the >10wpm bands (or even finer grain.)

For example, more often, a ham radio operator SHOULD be able to grab a $2 PHEMT, create a simple board (with VERY FEW components) and have his/her 1dB NF 2M or 1.2GHz preamp. Nowadays, the poor schmuck will be spending $120 (or so) for some boutique preamp with 'magic parts or things' in it. (Well, 1dB NF would be a little tricky, even with a .2dB NF PHEMT, but you get my idea!!!)

Here in the US, technology is moving offshore, and even for strategic reasons, helping to motivate technology hobbies other than computer geekdom would be a VERY GOOD THING.

I'd much rather live in a world where ham operators can experiment with new or forward looking modulation schemes (sometimes with DSP), rather than only plan for a post-WWIII world, where there are a few radio sets and morse code is the only economical way to communicate.

The Morse requirement advocates seem to be approaching the fringe status of those who had stocked up their food for the YR2000 'issues'. I am NOT against Morse code, but against the prequisite for significant ham radio operation. The Ham community does have ALOT of morse operators, but TOO TOO FEW individuals who build their rigs (even significant parts of them.)

There are some cases (like you) that have the code and technology, but that isn't wrong. You would have both the code band endorsement and the experimental band endorsements!!!

John

Relax, I probably don't know enough to understand that AM is not used on
HAM. I looked at 1stopelectronics.com, chose the 10 meter radios and
ASSUMED that AM was used for HAM.
I do not intend to go CB'ing with these radios I just thought that if I
get a HAM license these might be the next set of radios to purchase.

>No If you want to buy a Ham radio buy it from >a reputable Ham dealer.
Not a Illegal >Storefront for Amp makers

(snip)

Anyone with the proper business can sell hammie radios...one needn't
even be a hammie.

>They are a front for the Xforce line of amps. In >fact Carriage
Car@aol.com wash who used to >post here has become one of the owners.
>Amazing the info you find out in these CB >forums LOL

And this upsets or pleasures you WHY?

"Live and learn."

>Exactly, the way made it sounds is you may >be a ham and want to use am
on 10 meters.

He can use it on ssb and that's where all the 10 meter activity is..

>Buy a real ham radio not a Illegally marked >Export radio

Oh? You still seem to be misinformed about what a hammie can use. I
suggest a refresher course, maybe a trip to the FCC site, maybe the ARRL
homesite and someone will be glad* (?) to assist you, or maybe even
Jerry will spell it out for you. Building on that, how many
manufacturers of hammie rigs can you name that currently are made here
in the US besides Ten-Tec..hmm?

This has been my own personal radio for the last few years. Just upgraded to a Yaesu FT-1000D and I no longer have a need for the 102. Its been modified for 11 meters and has the AM/FM board. Its really swings on AM with loud audio. A 20 watt deadkey swings 100 watts. Nice and smooth on side band. The radio is in excellent condition physically and electronically. Asking $490+ shipping

(I'll be reviewing the links, perhaps to bring my viewpoint up to date, and
reconsider restarting my hobby from 25yrs ago.)

Apparently, the world has changed indeed since I had my ham radio license. I
got mine (the old tech license) a few months before my First phone just to see
what FCC tests were like. I also played around, but it was before the most
interesting stuff that makes UHF on up really cool nowadays.

When I did take the tests (both the tech class and first phone) in approx 1971,
I was VERY disappointed as to the lack of technological depth (even as a
Soph highschooler) required.

In a way, we reap what we sew, and the lack of technical requirements has
further enabled a general movement towards a dominant communicator-only class
of hams. I am VERY happy to see that some of the code prerequisites have
been lifted, and I will certainly follow your links after this post. I'd also like to
see alot of very broad ham interest, that isn't dominated by communicator
type stuff, but also include more technology than currently today. Technology
MUST NOT dominate ham radio, because it is easy to overshadow the
purpose of communication. When communication almost fully dominates the
hobby, esp archaic modes, then technology might be getting too much of
a back-seat.

I'd certainly be willing to advocate a license class for ham radio operators that
would ALMOST make that endorsement into an indicator of some technical competency.
With any significant motivation of the level needed to learn code at 13wpm or

even 5wpm, the newbie ham could almost become a naiscent EE*... (*Well, maybe that is a little optimistic, but not too far off.) Perhaps I'd be more accurate to claim that a person could at least understand the terminology and the issues of design, building, testing and even computer interface. This would provide the toolset that would allow the more motivated individuals to continue on with some self-schooling.

It is probably fairly clear that my own interests are of a technical nature (both EE and software (OS, DSP).) All of my ham hobby interest was based upon the technical and innovation side, but that had seemed to be too de-emphasized.

I'll definitely give the ham stuff a look-see again. My own interest, being technical, would also include helping people who want/need to learn how the stuff really works :-). I am also NOT INTERESTED in taking anything away from ham radio -- code is good, but almost complete understanding and significant (not necessarily complete) technical self-sufficiency is also good.

John

And suppose you sell your rig to someone like twistie, who thinks
it's great to operate illegally and they assume it is you?

Wouffgang Larry, I don't see anything in there about White Supremacy
so maybe you're almost legitimate.

1. No Automatic Renewals - Agreed. We need to keep this economy
rolling one test fee at a time.
2. passing score 90% - Make it 100%. If Bruce Without Error can do
it, anyone should be able to do it. Some may have to study, though.
3. Code elements 13 wpm for General, 20 wpm for Extra. We've had 160
years to perfect the code. Lets at least get it up to the speed of a
greasy smelly dinasaur tty - 55wpm.
4. Make no-code license one year non-renewable. I've been told that
anyone can learn code in a matter of weeks. Make the NCT 6 weeks
non-renewable.
5. Cancel your league membership until they improve things - That's
been tried - just cancel it.
6. Complain to the ARRL when-ever you hear an idiot on the air, and
Complain to Al Gore when you see one on rrap (cc: Al Gore).
7. Turn in rule breakers to the FCC - Cuffed and stuffed? or just
send in their call sign?

> implemented mode of radiocommunications yet devised.

Dick, you got a fever, man? I've not once read anything like that
from you. Not once! But I accept that as an earnest remark.

And in the "easily implemented" remark, it may be easily implemented
if you've been -trained- in the USE of Morse Code, but just learning
the code characters and passing an exam doesn't make it easily
implemented. You have to use it. And to use it you've got to have
people out there not only willing to put up with every little mistake
you make, but to actually be there and work through it. Listening to
W1AW and code tapes may make one an Extra, but it doesn't make one a
CW op. Meanwhile, 160 years after the invention of morse code,
novices are segregated to spaces and places where few are willing to
go.

> Does that mean I or any other CW supporter would in any way advocate
> use of CW -at any time- to the exclusion of better more efficient modes?
> Of course not, again despite the rumblings of some anticoders posting
> here. I, and most other code supporters, routinely use advanced digital
> modes, some of us use them more than CW. Again, that does nothing
> whatever to diminish the qualities of Morse code. Some of us understand

> If you don't, that's certainly your privilege.

IMO, someone skilled in code needs to be on the Novice bands providing
the understanding that is required to get the next guy going with CW.
You've been a ham since Jesus was a Corporal. Make it your legacy.

I agree with Peter. As an EE, I would pass that test right now. As I have said before, we don't demand that every computer user learn 2s complement math (or even DOS) prior to allowing them to use windows, linux, etc. The very idea sounds rediculous to us. The CW requirement is no different. Just my 2 cents.

Several times every year, shortwave conditions are poor enough that voice
transmissions are unitelligible. If you don't have a computer to work the
other digital modes, the only possibility left is CW.

> Instead, with the increased ease with which signals are digitized,

You aren't always going to have a computer available. I know when I go
traveling, I sometimes take my radio but not my computer.

There's no reason to flame anyone. It is a difference of opinion that should be calmly debated.

chuckie your high school humor thing is just not going to make
it.....we all remember back you know when, when you were claiming
to be able to outsell anyone on certain amplifiers you were trying to
peddle and talking about your great shipping deals.....and then
how you got pissed off because you thought aes was charging you too
much on a used radio you bought from them...etc. etc. etc.....so
pal if you want to talk, take a walk.....if you want to eat, take a
seat...because i, your radio host , am going to make you eat those
words..... good buddy.....ps.(who were the two hams you paid off
in order to get your ham radio license you idiot)

2077. Federal Criminals

Newsgroup: rec.radio.cb
Date: 2002-11-22 00:19:29 UTC

Actually learning all about DSP is useless as it's built into the radio and
I don't have to do anything.

>
> And another poster commented that I simply not motivated enough

> is ... uh ... less than overwhelmingly enticing.

There is much more variety in the conversations on CW than I've typically
heard on voice. The range of topics is amazing. I communicated with
retired teachers, "talked" about eBay, etc.

> bands (or even finer grain.)

There is a basic ham license without code. It's called Technician. They
have all privileges on all ham segments above 30 megahertz. There are some
fine individuals doing great work in that realm. And some are even using
the 6m and 2m code band segments to work on their code so that they can pass
it to get on the HF bands.

Actually if you limit them to phone only until they learn higher
endorsements, too many will simply stay there. Allowing phone privileges
should be the treat that they get after proving themselves competent in
other areas of ham radio.

Wouff Hong,

I'm not sure where you from, but that's beside the point. I read your suggestions to improve ham radio, and, as some one who is very proud of the organization they are from you wanted to let other people know your thoughts. As we both can see, it's raised a lot of havoc and questions and that sort of thing.

I must agree with you about some your suggestions, but lets look together at what you stated.

> Step 1: No more automatic renewals. Individuals must retest and
> pass all elements required for their license class.

-I feel the same way with this, because I think everyone should retest to get their driver's license every 10 years. Now we gotte realize how much a pain in the rear this would be, and not only take people away from this great hobby. It would be a good idea instead of retake tests, but to really encourage individuals bursh up on their skills, knowledge or electronic theory, etc.
>

> Step 2: The passing score for written exams needs to be raised to 90%.

-Again I agree that the level of accomplishment should be raised so people have good moral standards and treat with repect what they have their hands on when they worked hard to earn their Amateur license. 90% in manys' opinion would be to high; and it would frighten and discourage people.

> Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

-Morse code, a favorite of many, and not so great of many, but who is to say good or bad. Personally, and maybe others like yourself have to say that morse code is the the "basics" or any form or radio. Just because we had to take those tests when we got our licenses doesn't mean others have to. It would be a better idea to encourage people to do the morse code because if they do, I've found they stay in radio longer because if they have what it takes to learn the morse code; they'll generally apply the same learning habbit in other areas of radio. Please don't Misunderstand me, many people don't like it and are very active. But lets encourage and not say anyone has to this or that.

> Step 4: Make the no-code license one year non-renewable.

-Sounds like a good idea, but tis better to encourage people to move on and help them along the way, then bark at 'em like their bosses do.

> Step 5: Cancel your league membership until they decide to work
> to improve things.

-If league's don't have memberships, they can't support us and improve things. Memberships provide income for our leagues to improve things. We all should encourage people to join a league of some type.

> Step 6: Complain to the ARRL when-ever you hear an idiot on the air.

-Nobody is perfect in this world except God. When people who is arrogrant operate, I find out someinfo about them and kindly correct them over the phone or in some kind of private conversation. Nobody likes to be humiliated in public or at anytime. Besure anyone who does this makes sure the other person needing correction is open to it. As the cliche' goes; " A man convinced against his will, is of the same opinion still."

> Step 7: Turn in rule breakers to the FCC.

-Same as above; Nobody is perfect. Constant offenders have some challange with some one or something which some one needs to find out what the deal is and help him out with it. People just doing harm out of no reason does need to be turned in however.

Hope this helps. As you can see I mentioned the word encouraged lot because many people are guilty of this, myself included. When people are guided to the direction they want to go, they will go. There is a story that goes something like this. "The sun and the wind cloud were having a contest to see who could have a man in the park below take off his coat. So the wind cloud says he'll go first and the sun hides behind him. The wind cloud blows and blows but the man in the park just holds on to his coat tighter and tighter. The wind cloud gives up and the sun comes out and just shines his warm rays down below to the man. The man removes his coat and goes pleasantly about his business." If the moral hasn't bern figured out by an intillgent individual like yourself, it is that when someone is forced to do something, they simply won't, or they'll possibly grudingly do it. Ask and encourage someone to do something and they'll give it all they got for their best effort.

Hope this Helps,

Respectfully,
~Benjamin, KB9LFZ

Is this really needed to use a CB radio? And if one gets a CB+ licence will
Hams still accuse people of being a "CB plusser?".

From: yeti@REMOVEcet.com
>Why not just get a ham license? Then you can play with a whole lot
>more spectrum, a whole lot more power, and a bunch more operating
>modes. The test is easy when they give you the answers. Wan't HF but
>are too lazy to learn 5 WPM? Just wait a year or so until they drop
>the code requirement.
Yes, why not? Any CBer that is interested should get a Ham licence for these
reasons. The test is easy enough, so why not?

As for spectrum, more is better. Some modes are better with some frequencies.

2120. Re: 7 steps to improve ham radio.

Newsgroup: rec.radio.cb
Date: 2002-11-22 06:14:13 UTC
From: KC8PMX <kc8pmx@NOSPAMdiamondcs.net>
Message-ID: <arnpdd72nl0@enews2.newsguy.com>
Source record: 144796
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb,rec.radio.shortwave

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

This one I actually agree with. If the statements made by certain indivuals about "growing" with the hobby and climbing the ladder of licensure are to be true, then hams should not have a problem taking a test that should be a breeze since they have "obviously" advanced within 10 years....

Step 2: The passing score for written exams needs to be raised to 90%.

Dunno about 90%, but think that 80% sounds fairly reasonable. Add more questions to the test, and choose other formats of testing other than multiple-guess too.

Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

See not a huge problem there, but never understood why 13 for the General. Why not 12, or 14, or ??? What is so special about the 13 wpm? Anyone know why they chose 13 for the "middle" code test?

Step 4: Make the no-code license one year non-renewable.

2 years seems like a fairer option.

Step 5: Cancel your league membership until they decide to work
to improve things.

Hmmm.... could start a whole new newsgroup on this one.........

Step 6: Complain to the ARRL when-ever you hear an idiot on the air.

They are not our governing body, nor will I ever accept them as our "governing body." It is bad enough that they have taken over the testing duties.

Step 7: Turn in rule breakers to the FCC.

DUUUHHHHH!! All should do that.... but follow proper policy/procedure when doing so. Also work towards the goal of getting the FCC to actually do something about that in the first place.

All in all, the problems people want to bitch about regarding ham radio stems back to the FCC each and every time. They make the rules/policy/procedures and they are the ones to blame. HOLD THE FCC responsible.

Actually, they should probably limit the power for the 'communicators' to less than 100W, and the higher technical licenses would allow for higher power :-). The 30MHz, I guess, is still a treaty thing, and indicative of stagnation. Maybe the 'communicators' with little technical criteria might even be limited to 10-50W at VHF and above.

The goal isn't to punish people, but to motivate people to learn how their stuff works. I suspect that the VHF bands are too full for much experimentation, but the technology for homebrew on 2GHz on up is now relatively achievable by mere mortals.

Wouldn't it be cool if people really designed/built their own stuff that makes sense to do so, rather than buying their devices from boutiques? Alot of stuff isn't really practical to build (e.g. the communicator 2M units, or walkie talkes), and the stuff that is extremely practical to build (10M transmitter) even with few mechanical skills, would be constrained by the code requirement.

So, for the newbie, where homebrew is more practical below 100MHz, the code constraints tend to continue their burden.

I look at the code requirement a little different..... If it is so important, then ALL radio services should have to pass at least the same minimum 5wpm as we do.

Hmmmm.... most US states already do that somewhere between every 2-4 years.... As well as they should too... And they also need to start testing senior citizens more often too..... (not gonna state what age they should start that at though...) I have worked a variety of accident scenes where the scene was clearly marked and using on the fire trucks to block the lane, with lights operational, pile-on orange cones, road flares etc, and a senior citizen still plowed into the firetruck. He claimed they could not see it..... Jeesh, you could see the scene from a freaking mile away!!!!!! Yeah, I am all for retesting on a fair basis.

> other areas of ham radio.
>
The limitations for those without the 'technical competence' endorsement should
probably be a reasonably low power like 20-50W on VHF/UHF and/or 100W for HF.
Phone should probably be the first mode of communication, mostly because
of the relative usefulness (e.g. during normal disasters, to help with communications,
phone will more often be useful rather than code (unless there is a WWIII)). During
urban disasters, if we are having to deal with code, the situation is probably
severe enough that ham communications ettiquete would be the least of our worries.

There certainly should be reserved areas of the HF bands for code, and those
people with/without code who haven't passed the technical criteria for the
technology endorsement, will be limited in power. Really, if someone cannot
quickly whip up a preamp/active impedance match for an HF frontend that
has to work in an area near a 50kW MW transmitter without overwhelming
intermod, then it kind of worries me about how the ham is going to competently
deal with the numerous issues of using their 500W-1kW rig. It isn't just
a matter of getting on the air, but also avoiding interference with TV (including
nowadays 8VSB), AM/FM radio, and other more important services.

People do get 'on the air', and usually do the right thing, but it is VERY SAD
that too few people build their own equipment. Of course, CBers had historically
been known to simply slap on an illegal 'linear', and their rigs sometimes worked
okay also (often with anti-social interference :-)).

Of course, my attitudes about technological competency can be mapped to
the equivalent attitudes of those who have already passed the advanced
code tests. In the normal profile of natural/terror disaster, the availability of
a radiotelephone communications mechanism would be much more useful
than if the 'HRO' only had a code rig.

Yep... overall the hobby is declining, but it is not from the testing procedures. Anything viewed worthwile by someone is worth pursuing as well as whatever obstacles along the way. The root of the problem is in the PR side. I still run into tons of people that didn't even know ham radio existed. A much smaller group associates it with CB from my own local area experiences. We need to promote the hobby more. We need to get ham radio into the schools, associate it with the cirriculums. We need to start doing things that WILL get people coming to us, to become hams. Testing sessions with a mere few testee's definitely reflects that there is a problem with promotion of the hobby. But that would take actual action by people and god forbid that eh????

I just like to change my nic when you do just to water down the
effect of your changes. Since cumcast now puts the IP addy on each
post, it's easy to see where one is.

68.45.70.216 = pcp115440pcs.clmntn01.nj.comcast.net

If you reboot, you might get a different IP. Since I grab an IP
with a Unix box, my IP can stay the same for months. It took a
whole weekend of being off before I changed from 68.55.4.181.

Should I wipe out /var/db/dhclient.leases and shut down for
a day while I'm at work and get a new IP?

Happy hacking. Logging is active. Anonymous FTP is always refused.
Telnet is disabled. Passwords are random characters. Ports 135 to
139 never get past my 192.168.0.x internal non-routeable subnet.

I don't need no stinkin' MSCE. I know places that toss resumes
with that on it. A+ means nothing except to HP. It is another
test that the answers are sold to, like a ham exam...
(HAM exams are not for sale, just the answers to the tests.) 10-4?

Your bias against the reference was established even before you knew the source. If you can't look at the facts objectively then they won't make any difference. You prove that all the time because of your attitude that "Da' facts are subject to revision". Regardless, see below.

<snip>
>I trust the statements made by the original authors, well over

You want to talk about quality or quantity? About websites or newsgroups? Do you just want to limit it to the internet, or would a college thesis count (several, in fact)? How about five years of formal failure analysis reports? Or more than fifteen years of repair records? Do you actually think the whole RF world revolves around a few pages posted on the internet? You are a moron, Skippy.

<snip>
>You got a current mfgr that suggests inclusion of resistors and
>caps in a current generation of common rectifier diode strings

>found in rf amplifiers.? Say the 1N5408 as an example..?

Within five minutes on alta-vista I found two:

http://www.vishay.com/docs/rect_apnote.pdf
(formerly General Semiconductors, bought out by Vishay)
http://www.st.com/stonline/books/pdf/docs/3581.pdf
(ST = SGS Thompson)

...as well as a few other articles:

http://www.radioelectronicschool.com/reading/reading20.pdf (page 10)
http://www.chipcenter.com/power/powa043.htm
http://straylight.cso.niu.edu/repairfaq/sam/laserclp.htm
(A Treatise on Designing High Voltage Rectifiers)

Your buddy Measures read the ARRL notes regarding manufacturing tolerances in semiconductor manufacturing, but what he didn't mention on his webpage was that while many rectifiers from the same lot may have matching characteristics, using rectifiers from the same lot doesn't necessarily mean they are matched. And because silicon semiconductors have a negative temperature coefficient, they need to be CLOSELY matched for power applications, EVEN IF they are from the same lot! The cost of matching power rectifiers to save a couple cents in resistors isn't cost-effective in manufacturing, and isn't very practical or reliable for the average homebrewer. Not only that, but any manufacturer must consider that if one or more rectifiers should fail, there is no guarantee that the servicing technician has a rectifier that matches the remaining set, or even that he has easy access to a matched set for a full replacement. So it's a poor engineering practice in that respect as well.

But if you think that not using voltage equalization makes you look like a hot-shot, then go for it -- you aren't gambling with MY money!

<snip>

I have a shorted resistor sitting on my shelf but that doesn't mean
I'm ever going to find another. Seems to me that you greatly improve
the odds against parasitics by the little bit of money and effort it
takes to include some low-Q supression. But like I have said before,
it's your money, not mine.

>> Now because of the high operating frequency possible with that tube,

The archives are over 10 megs compressed. That's not lazy, that's foolish.

> I'm pretty much done with your
>depression laden posts. Nothing is ever going to make you happy
>and you wont post the locations of your touted reference material.

That's what I thought -- more excuses because you can't support your own bogus claims. Probably just another lie, like your license for the IB service, and your claim that you found my FCC files. You can't provide the proof so you use the typical lame excuses just before you bail. Well then leave already, Skippy. What are you waiting for?

<snip>

Then "debate and discuss the issues" here, Skippy. Don't just tell me
that something works because someone posted it on a listserver (then
tell me to go look it up myself). If you want to reference someone
else, post the words and the credentials, don't just say "someone said
so, go look it up".

>Possibly one issue of a larger picture, but not given as the only one.

You sure do get wishy-washy when faced with logic, Skippy. Like with
the lack of neutralization in a grounded-grid amp you claimed that
reduced Cgp and 'grid screening' were responsible, nothing else. But
when I logically proved you wrong you suddenly said, "there are other
reasons". Well, you haven't provided any other reasons. And I don't
expect you to elaborate on your "larger picture" regarding the 8877,
either.

>When all your previously mentioned "ifs" are out of the mix, an 8877
>built as described in the example is stable without anode parasitic
>supressor(s). It's that simple...

Then it's just as simple to say that "if" the grid circuit is free
from resonant conditions (an impossible condition), or "if" there is
insufficient coupling to any grid circuit resonance, or "if" there is
adequate screening between the plate and grid circuits, or "if" the
grid is shunted with an anti-resonant trap, or "if" there is
sufficient plate-to-ground capacitance at the plate, etc, etc, then

the amp is stable. There are your "IFs", Skippy.

<snip>

>
>You make my point... only contributing factors of a larger picture.
>Each tube has different values... the 8877 values are dealt a good
>card by design.

Do you even realize how hypocritical that sounds? First, in order to
explain why some tubes are prone to parasitics, you say "Simple,
internal values of C and L and the tube geometry". Then after
realizing the truth that tubes are not the only cause of parasitics
you suddenly say "only contributing factors of a larger picture". Very
wishy-washy, Skippy.... No, not even that -- just more proof that you
don't know what you are talking about. So is "a larger picture" your
catch-phrase for this week, Skippy?

>> >Old information, no one claims it's inaccurate. Are you trying to

>the typical grounded grid amplifier does away with neutralization.

How? You still haven't explained how your "reduced Cgp" contributes as
a reason why the grounded-grid amp doesn't require neutralization. The

fact is that you can't because it's not a factor. If you think I'm
wrong then explain HOW it IS a factor.

>> >> screen grid is effectively grounded (unvarying DC potential) in a

No smoke screen. What is your "larger picture"? It seems to be your
most current catch-phrase for things you don't understand, because you
certainly don't seem to have any other explanations other than "it's
part of a larger picture". Quit with the mumbo-jumbo and address the
issues, Skippy!

<snip>
>> >Effective C is also reduced when you apply that tetrode to grounded grid

>
>I know of no commonly accepted practice of placing grids to plates in
>RF amplifiers... maybe you could point out EVEN ONE example. Let

>me rephrase that... EVEN ONE WORKING EXAMPLE...?

Are you so desperate that you STILL need to rag on that issue? Or do I have to point out once again that I spoke of tying the SCREEN to the plate, NOT the grid? Actually, I don't think that would be such a bad idea, now that I think about it. It would certainly improve the amplification factor of the resulting triode (over grounding the screen), but the grid current would have to be watched very closely in Class AB2. It might just work pretty good in Class C... maybe one has already been built. I might just get back to you with that example...

>If you examine most of the current generation / production amplifiers,
>you (or most everyone else with their eyes open) will probably
>notice the lack of equalization networks on the rectifiers. ITS
>NOW COMMON TO OMIT THEM as they are not required. ie dated technology.

If YOU actually examined most of the modern equipment that uses HV power supplies (RF amps included), you would have -definitely- noticed the use of RECTIFIER MODULES, which are series rectifiers with built-in voltage equalization resistors. No matter how much you whine that it's not true, your "dated technology" is still current, valid, and practical.

<snip>
>> Save us all some time and quote your reference.

>> of the window under your catch-all excuse that it's "dated".
>
>What is the date and edition of the book...? after you actually
>tell us the name you so cleverly withheld.

I have used that book for a reference in this newsgroup many times (among others). I concealed nothing. And as a matter of fact, the date of the book indicates that it is one of the last textbooks to cover vacuum tube electronics in depth, which means it's about as up-to-date as you are going to get on the subject.

But you don't even need a reference on the subject, Skippy -- you just need a brain. Let's start with a basic grounded-grid triode:

When the input signal pulls the cathode to it's most positive, then the cathode-to-plate current is minimum, and the power supply will pull the plate to it's most positive potential. The positive potential of the plate is going to have the effect of pulling electrons into the cathode, but because there is little cathode-to-plate current, the majority of electrons attracted by the plate create a log-jam in the cathode. Therefore, the plate (output) causes an opposing potential on the cathode (input). But when the cathode is at it's most negative, the current is maximum, and the plate drops to its lowest positive potential. Note that the plate is still positive with respect to the cathode. But because there is a significant flow of current, the plate tends to pull the cathode more POSITIVE by pulling the electrons OUT of the cathode.

The overall effect is DEGENERATIVE FEEDBACK.

Maybe you now see that it is the PHASE of the grounded-grid amplifier that is responsible for it not requiring neutralization, NOT "grid shielding" or "reduced Cgp". You might even say that a grounded-grid

amplifier is 'self-neutralizing'. The only time a grounded-grid
amplifier needs neutralization is when the frequency becomes so high
that the inductive reactance of the leads becomes significant enough
to mess with the phase.

<snip>
>> But still no evidence that supports your claim that the tube is immune
>> from parasitics.
>
>Examples and supporting information from experts in the field, posted
>within the last month at www.contesting.com

You STILL don't understand that the tube is not responsible for
parasitics. Try this link, Skippy:

http://www.cpii.com/eimac/PDF/C&F3Web.pdf

I'll be waiting to see how you flip-flop over another Eimac page: will
you cannonize the former Eimac engineer that supposedly wrote this
book, or will you dump on the company about their "issues"? I'm
betting the latter because the information doesn't agree with your
theories.

Hey, here's an idea, Skippy? Why don't you get a job with Eimac and
'revise the facts'? LOL!

<snip>

>
>"Common practice" by whom..?

GE, Motorola, Regency, Johnson, RCA, etc. Just about every company
that ever built tranceivers with T/R relays used some sort of
sequential relay. Many microphones also have sequential contacts, a
practice for which GE is notorious.

>A relay "Sequencing" notation seems to be missing from the circuit
>diagram. You are again chasing windmills...

And you are having a hard time with your reading comprehension: see
above where I said, "Schematics don't usually indicate when a relay
operates in this way". Regardless, sometimes the sequencing is done
with two relays, and sometimes with one relay using different contact
gaps. But you will be hard-pressed to find a schematic that makes any
notation about the latter. Anyone that has ever done any amount of
radio repairs knows exactly what I am talking about. It's obvious that
you don't.

>Your bent armatures suggestion is bad news.

Such "bad news" that the practice has been used by almost every
manufacturer of transceivers since they were invented? Right. Uh-huh.
Ok. Next you are probably going to proclaim that relays are "dated
technology". Sure thing, Skippy. Whatever you say.

I do, and so do a lot of hams that have any working electronics knowledge,
but you don't get that by simply memorizing the answers to 30 multiple
choice questions...

> Alot of stuff isn't really
> practical to build (e.g. the communicator 2M units, or walkie talkes)

My first 2 meter rig was a kit (Heathkit), as were the first pair of walkie
talkies I ever owned (Allied Radio).

>, and the stuff
> that is extremely practical to build (10M transmitter) even with few
mechanical
> skills, would be constrained by the code requirement.

The only practical 10 meter transmitter that one with limited skills
might be able to put together would be a CW transmitter, so it would be
of no use to a person that did not know code.

> So, for the newbie, where homebrew is more practical below 100MHz, the
code

What burden? There is nobody forcing them to become a ham. It is something
that one does because they want to do it. And according to their level of
effort and dedication to the hobby, they are rewarded with additional
operating privileges.

In the Mark IV transmitter there will be either a 1302 or 1702 IC chip -
that's the main one for the PLL and is the one that blows when there are
voltage problems from the receiver.

In the Mark IVA transmitter you should find either a 7808 or LM340-8 IC
chip.

- -
- - - - - -- -

Operating differences that may help you determine which model you have:

A Mark IV transmitter has 'stops' at Ch. 1 and Ch. 40 - a Mark IVA does not
have those 'stops' - when you get to Ch. 40 it should go right ahead back to
Ch. 1 instead of having to tune back down all the way to Ch. 1.

On a Mark IV transmitter the 'Reset' switch takes it to Ch. 1. On a Mark
IVA transmitter 'Reset' is the normal operating position and does NOT switch
to Ch. 1.

On a Mark IV transmitter the two LED's on either side of the channel display
indicate high and low limits. On a Mark IVA those two LED's may flash
momentarily when changing channels but should stay on unless a failure
occurs in the synthesizer (indicating an out-of-lock problem).

Nighthawk

Yeh, why not get a ham license? How's the studying going, Frank?

I don't know about the "lazy" bit though; I had the code learned
several times as a teenager but cannot seem to get it re-learned now.
There's more to it than being lazy, I assure you.

BTW, they are going to "consider" dropping the code requirement at the
international Conference in 2003. It is by no means assured that the
FCC will drop the requirement.

The original CB license cost money, $20 IIRC. All they'd have to do is
charge for the CB+ license and it'd pay for itself. And maybe even
make a few bucks for the FCC to use for enforcement.

> mhz and 25.000 mhz to 26.500 mhz.

Ok, this is an interesting idea. I'll attempt a more reasoned look at
this rather than some of the more caustic replies I've read thus far.
Note that the FCC does not actuallt control ALL of the aforementioned
RF real estate, some is governed by the NTIA. However there IS some
room for growth...just not all the way up the the 10-meter lower limit
of 28.0000 MHz. The FCC had earlier earmarked a small portion of
spectrum above ch. 40 for a planned CB expansion that never happened.
Whether or not it is still at their discretion, I'm not sure? However,
let's go on the premise that it is. 27.4051 MHz through 27.4999 MHz
should do nicely for "hypothetical" purposes.

I agree with the return of licensing. With it, come accountability.
Sure, there'll be naysayers that'll say "What guarantees they'll
follow THESE rules?" The simple answer is NOTHING! Some will, some
won't...thus is human nature. CB radio, amateur radio, or any other
special interest group is just a microcosm of society at large.
There's no Utopian answer. A licensing fee however might help fund
increased enforcement. I, for one, can't understand how some folks
bitch and moan about the CB "criminals," yet give the FCC a "buy" wrt
their lack of enforcement (More accurately, abandonment.) over the
past 20 years? Those who obtain their licenses would likely be allies
in this enforcement.

> Not only would this be a good introduction to ham radio , It would also give
> Them the power to police Their own bands and have some recourse against
> quarmers and CB misfits .

You might find that those who DID put forth the effort to obtain their
license would be more apt to "drop a dime" on those who run over
powered gear. Those who run legally and assist in the enforcement
effort would reap the benefits (...increased power of, say, 30 watts
P.E.P., spectrum increase of 95 kHz, RIT, etc.)

> As for 11 mtrs , Let em have it . A CB plus license would set a whole new
> standard amongst CBers that honestly want to have decent and meaningful
> conversations on the air.

I'd personally like to see a shared band from 27.4051 MHz through 27.4999 MHz. Sure, there's the argument that it already exists in CB but that's not what I'm talking about. There's also the argument of "Why not just get a ham license?" That's an option, however, I recognize that it's not the same as an 11-meter "shared" band. It's a nice thought with some interesting possibilities but there are too many strikes against it for it to take flight. Most find more comfort in listing reasons it "can't" be done rather than exploring how it "can" be accomplished.

> 73" and keep it real.
> Crossfire.

...and to you, sir.

Isn't it a hoot that when someone like "Scooter Tramp" or anyone else says something the hammies don't agree with it's a "troll", but the self appointed policemen of the group can spam as much as they want and it's
ok?

Yes Scooter Tramp, you must realize you are in RRCB now, where everyone except
those who are high and mighty like Jim, Jerry, Fred, Doug, Frank, Dave and Leland (sorry for any assholes I didn't mention) is guilty whether proven innocent or not, regardless of what they may or may not have done. Of course, keep in mind that these good amateur operators are all operating strictly legally, and would NEVER do anything wrong since they are all such good citizens, and fine representatives of the amateur radio community. Anyone who does not conform to their way of thinking falls into the category of "Federal Criminal" or "Keyclown". This used to be a good group back in the early 90's where free speech was allowed and the hammies and policeman want-to-be's didn't disrupt things like they do nowdays. There is still a good group for CB discussion and technical advice that has not been corrupted by the likes of these people, where all the "good" technicians still answer questions like in "the good old days" without all the unwanted comments from those who don't agree with what is going on. The disgruntled hams in here are accomplishing nothing except wasting bandwidth in the NG because they are able to "push the buttons" of the few cb'ers left in the NG and they feel compelled to respond to them. This group should be called rec.amateur.flamefest instead of rec.radio.cb as it is known today. The best thing that could happen to this NG is for Usenet to remove it from their servers as it serves no useful purpose, and the hams would be left to flame each other (as they already do) over in the amateur groups. The only way this group will ever amount to anything or serve it's intended purpose, is to be reincarnated as a moderated group. I can't believe someone hasn't done this already for the good of those who would like to post here but don't.

> >
> > There already is - it's called a No-Code Tech.

Actually, the licenses say "Technician". Nothing about code or nocode
on any FCC ham license. And all US hams are allowed to use Morse code,
test or no test.

A distinction needs to be made between those who are against the code
TEST, and those who are against code USE.

> > > To work at all in the
> > > 'code' bands, you'll need to pass the code test (similar to the good old
> reserved
> > > bands for extra

WHY? There's no requirement to pass such a test today. In fact, 6 and
2 meters have the only "Morse only" segments - and they are open to
use by Techs who haven't passed a code test.

> > Let's just keep it simple. To work any band / mode below 30 mhz. you need a
> > higher class license (oops, that's how it is now... :>)
> >
> Actually, they should probably limit the power for the 'communicators' to less than 100W,
> and the higher technical licenses would allow for higher power :-).

Probably a good idea, because then the RF exposure questions on the
entry-level tests could be tailored to the power levels permitted.

> The 30MHz, I guess,
> is still a treaty thing, and indicative of stagnation.

Nope. It's simply a treaty requirement. Once upon a time the
requirement was for all ham licenses. Over the years an exception has
been included for VHF/UHF because there is relatively little routine
use of Morse by hams on VHF/UHF. The limit has gradually been lowered
at various WRC conferences - 1000 MHz, 144 MHz, 30 MHz. Next year it
will probably go to 0 Hz ;-)

Before judging whether "code is dead" or "obsolete/outdated/nobody
uses it anymore", try actually LISTENING to the ham bands below 30 MHz
- particularly the lower ends of the bands, where Morse use is most
common.

This weekend would be a good time to listen.

> Maybe the 'communicators' with
> little technical criteria might even be limited to 10-50W at VHF and above.

Sure.
>
> The goal isn't to punish people, but to motivate people to learn how their stuff works. I

Plenty of room on all bands for experimentation.
>
> Wouldn't it be cool if people really designed/built their own stuff that

I do that, and have been doing so, for more thna 35 years.

> A lot of stuff isn't really
> practical to build (e.g. the communicator 2M units, or walkie talkes), and the stuff
> that is extremely practical to build (10M transmitter) even with few mechanical
> skills, would be constrained by the code requirement.
>
> So, for the newbie, where homebrew is more practical below 100MHz, the code
> constraints tend to continue their burden.

How does the requirement to learn code at 5 wpm just well enough to
pass a test unreasonably constrain the ability to build radio
equipment? Hams have been building rigs long before there were
licenses without code tests. Heck, I built my first transmitter at age
13 - right after I passed the code test. That was not at all unusual
in 1967.

The REAL "burdens" of home design and construction today are the
practical and economic constraints. Manufactured ham gear, and kits,
are inexpensive and plentiful today. What sort of projects would you
recommend for the raw newbie?
Do you think it's practical for a new ham without an extensive
electronics background to design and build an HF SSB transceiver as a
first project?

"I am only a lurker in this newsgroup"
****
>What an auspicous start Lurker to Troll.<

He's a troll for defining the truth concerning the laws our great
country was founded upon?
George, obscuring the truth has always been a goal of yours.

"and don't usually (maybe one or twice) have much to offer.. "
****

>still don't<

Well, he just contributed exactly what the majority of the masses
already know.....it is obvious a bit of education is deemed a threat
by you, especially the truth. The truth has ALWAYS been a threat to
yourself, Lelnad, Frank, Hall, and Adair...oh, and lately Paul down in
McCallister jumped into the foray.

"that said.....I keep hearing the term Federal Criminals
used in reference to : outbanders,amp users,truckers,speeders,people
stealing paper clips,etc.,etc."
****
>Ok would you prefer federal law breakers?<

It doesn't really matter what we prefer......the fun is derived from the
ignorance of Dave and Frank's, and now your interpretation (which has
been proved wrong, even by the feds standards) of the judicial system.
Whining does nothing but highlight how little you all know concerning
the laws of the country y'all lie about. (you demonstrated as much with
your comments about a hammie usng a Galaxy) The false concerns y'all set
forth concerning rules are phoney and false, evidenced by the mass
exodus of ISP's taken from Frank, Lelnad, Doc, and Dogie for violating
said rules. It is also illustrated in Hall talking out both sides of his
hypocritical hole, calling people names (IE: criminal) for behavior that
doesn't even come close to the crimes he has committed.

"We (not including those in Canada,U.K.,Oz or else where) live in the
United States of America"

>Ok If we didn't live elsewhere I guess we do >live in the Untied
States. Brilliant! Simply >brilliant!

And are considered innocent until proven guilty by a court of law. Funny how you hypocrites selectively ignore that law that makes all innocent until adjudicated otherwise. This also illustrates how the dogpile members (you included, George) feel yourselves above the laws of this country and appoint yourselves judge and jury. Talk about no respect for the laws our country was founded on..bwaaaahahahahah!

"and as such,are covered by our laws."
****
>Yes, similiar to those same ones that the >federal lawbreakers are not following.

According to Dave Hall N3CVJ, those mentioned in the rainreport and those who
have had any contact with the FCC concerning
any type violation, are federal criminals.

"Those
laws state that NO PERSON shall be concidered a criminal until proven guilty,not by a newsgroup of his peers"
****

>Whoa better ask twisty these guys are >admitted law breakers no one had these guys >under hot lights interrogating them, an >admission of guilt? they are proud of it and >admittedly so.

The word "proud" has been shown to be a favorite of yours, Lelnads and Franks. You 3 are the only entering it into an equation. No one ever used that term concerning such activity. When you begin to lie, you remind me of Dave Hall. He can't go a post or 2 while holding a debate without getting personal, insultive, or telling a lie. On another not of truth, it is losers not unlike yourself that constantly and redundantly feel they are owed an explanation of "why" al the time. It is YOU clowns that NEED an explanation. When you fail to elicit a reason from us for your personal satisfaction as to why we do anything, y'all begin with the "proud" stuff. Bettre stick to the facts, lest you wind up with a ruined call like the other few, but if you don't mind, I don't mind.

  (one way or the other) but by a court of law,
****
>How about an admission of guilt?<

Ha! Even one who admits guilt still needs to be found guilty by a court of law. Many, many times people have admitted to crimes they haven't committed. And since I was adjudicated crazy and not sane by my church which you are so desperately attempting to join, my admission means nothing. Ha!
But just for the record, I will continue to DX adn you can continue to be a source of entertainment along with your other fruitflies who have no concept of law whatsoever.

"Therefore only those persons "convicted " in federal court are legally concidered "Federal Criminals"."
****

>Ok federal lawbreakers is more fitting<

Again, changing your terminology serves only to make the educated among us grin.

>now go wash off.<

Plagiarism has been a strong suit of yours lately, Geo. I'm touched. You know what they say about imitation.....

"They may not follow all the written rules"
****
>Yes just the ones they want to follow,<

Like Dave Hall n3CVJ, Lelnad scott Kc8LDO, Starman sasquatch hunetr Frank Gilliland in Issaquah, and Dogie N8WWM.....

"FCC,Traffic,Office Supply System,etc.) ,and you may not agree with their actions,but they are not Federal Criminals."
****

>Ok once convicted they are,<

By your own tongue, you finally admit the dogpile of Lelnad, Frank, Davey boy "hypocrite" Hall and the head dog of Adair have all been wrong all along. See , that wasn't so hard.

>for now they are federal Lawbreakers. Now >take your hankie and run

You have some more learning to do. Better check how many cbers adn hammies were stripped of their civil rights after being contacted or fined by the FCC. Federal criminals are stripped of such rights. How many can you name? Any? S' ok. We all knew you losers were wrong all along....we just think it's quaint y'all share your ignorance in the hopeless hope that get others will share your juvenile and misiterpreted ignorance concerning American law.

Being a ham doesn't offer any of the above with the exception to more spectrum. One can operate all the modes one wishes on 11, they work just as well on 11 as they do 10. Some run as much power as they wish.

>Except you can do all that on the ham band >and know you are doing it legally.

Yup,,it sure is..until that dial is turned and y'all come down to the freeband and try to be heard 'cause there ain't much hapening on 10.

Here's what I'd like to see happen with the "CB" band. With the technology we have today, I'd like to see everyone get their license again. Built into every radio (and non-modifiable) should be a unit which broadcasts your call sign with each key.

>And suppose you sell your rig to someone like >twistie, who thinks it's great to operate illegally >and they assume it is you?

Don't worry, JJ. I don't buy hand me downs from hammies. Much of second hand hammie gear usually carries an odor of cigarettes and who knows what else? Besides, where did I ever say it was "great" to operate illegal? George talking like Dave, you lying like Frank,,seems like some people are really scrambling and reaching for damage control.

"A_Real_CB_Operator" <cb_ops@limacharlie.com> wrote in message
news:XPVC9.18578$NV.356979@news.direcpc.com...
> 1. MANDATE THE LICENSING OF ALL CB OPERATORS - NO EXCEPTIONS, NO
> WHINERS, NO CRY-BABIES AND NO MORE PROBLEMS!!

Used to be that way, but the FCC got tired of all the non-licensed operators so did away with the licensing requirement. Doubtful they will ever impose licensing again.

> 2. ALLOW FM ON CB

Not a bad idea. However, with 10 kHz channel spacing, it will cause a lot of interference to the other channels. You'd need about 25 kHz channel spacing, even with NFM.

> 3. BAN THE LINEARS!

Already illegal.

> 4. ADD ENCRYPTION / DES / CTCSS / PL / SELCAL

I don't think they'd allow encryption, but not a bad idea if you wanted private conversations. CTCSS and PL are the same thing, and would work OK if you wanted to not have to listen to all the other operators out there, unless they use the same PL tone. Selcall is another good idea that would make it easier to get hold of someone.

> 5. INCREASE AM AND FM OUTPUT TO 10 WATTS

FM would probably need to use 10 watts, as the signal is a bit wider than AM.

> 6. LCD DISPLAYS INSTEAD OF THE LED CHANNEL /FREQUENCY DISPLAY

You'd need to talk to the manufacturers about that. For some reason they love using LED's which you can't see if the sun is shining directly on them.

> 7. ENHANCE THE "R.E.A.C.T." NETWORK!!

That's up to REACT. I think they're kind of hurting for members right now. I looked for active groups in my state, and I think there were only two for the whole state. They need more volunteers. The way they could do this is to reduce the annual membership fee. Of course, one doesn't necessarily need to be a member of REACT in order to respond to an emergency. You could spend your own time monitoring channel 9 whenever you can. If you do find someone needing help, get as much information as possible using the who, what, where, when, and why method and pass it on to authorities. The most important two will be where and what.

> 8. MANDATE REAL CALLSIGNS ---NOT made-up HANDLES!!

Only good if licensing is in effect.

>
> 9. GET OVER IT AND PUT AN END TO THIS STUPID WAR BETWEEN THE AMATEUR
> RADIO COMMUNITY AND THE CB COMMUNITY!!!! ARGUMENT IS FUTILE AND
> POINTLESS!!

Not a bad idea.

> 10. GO ON A TALK SHOW AND HAVE AN ALL OUT "HOLIER-THAN-THOU WAR"
BETWEEN
> CB'ers AND HAMS!!

Wait a minute, I thought in number 9 you said to end the stupid war? Or are you just looking for some fake "Jerry Springer" entertainment?

> 11. ENFORCE THE CB RULES AND REGULATIONS!!!

The FCC has generally given up trying to enforce CB rules. They are severely understaffed & underbugeted. Only if they were bugeted money to enforce CB rules would they take action.

> 12. PUT CB CHANNEL 9 ON FM FOR REAL CB'ers and replace the CB's in Hwy
> Patrol Vehicles and Sheriff's Offices with Better Equipment for clear
> channel comms.

Not sure what you mean here. Most police vehicles with CB's in them have had the CB's put in by the individual officers at their expense. The police radios aren't CB's.

> 13. STAFF THE FCC WITH CB'ers AND HAMS WHO KNOW RADIO OPERATIONS AND ARE
> NOT AFRAID TO ENFORCE THE RULES / REGULATIONS ON EITHER BAND!!!

Good idea.

> 14. CONFRONT CB VIOLATORS WITH AUTHORITIES PRESENT -instead of being a
> dumbass and getting shot before you can get out of your vehicle to
confront
> the individual in question!!

Do you mean individual citizens, or FCC personnel doing the confronting?

> 15. CRY TO WOUFF HONG THAT HIS IDEA WAS REVERBED BY "A REAL CBer"

Imitation is the most sincere form of flattery.

> 16. Quit Cryin' to the truckers about your CB!!

Not sure what you mean here.

> 17. A "Good-Buddy" is NOT a term referring to one's sexual lifestyle!!

It may be if you practice an alternative lifestyle. Look at the Skipper and Gilligan with all that "little buddy" talk!

> 18. "Hand" sounds so stupid when talkin' to another cb'er!!

"Hand?"

> 19. Use RDF equipment to find the jammer or culprit, instead of threats
> to "kick someone's ass" all the time!! (so pathetic!)

Usually if troublemakers are shown that their location can be found, a lot of times they'll give it up for the day. But I'm sure it'd work better than saying, "just tell me where you're at, m***er f***er!"

> 20. Report ALL Activities Consisting Of :
> JAMMING
> THREATS
> SCHEDULED
KEY-DOWNS
> POSSIBLE BANNED
> LINEARS BEING USED!
> UNDER_AGED FOLKS
> CUSSIN' ON THE RADIO!!
> DRINKING AND
TALKING
> ON THE AIR!!
> SOLICITING FOR
SEX,
> DRUGS, WEAPONS OVER THE AIR!!

Where should they be reported to? Do you think the FCC is going to drive down with all their DF gear because you heard someone say "damn" on the radio? And since when has drinking & using a radio been illegal?

Umm... that's assuming that the CBer's already out there will be willing to plonk down money and take a test for something they're already doing.

> They will also save
> money because they wouldn't have to pay agents to go to truck stops to
look
> for illegal radios .

That's assuming that Joe Trucker is going to get rid of his 2950 and buy a Cobra 29 because he's afraid he'll lose his license. Not going to happen especially if the FCC won't pay agents to look for illegal radios.

> What better way to give FCC an economic boost than to tap into the wealth
of
> the CBers?

There are better ways, such as not reducing fines on illegal operators. Once again, I doubt most CBers would be willing to pay for a license for something they're doing for free right now.

That's assuming people will be willing to pay to use their radios. Sure,
some people will, but most probably won't. That's the reason the FCC
dropped the licensing requirement in the first place, that so many people
just weren't bothering to get them.

Interesting idea. It could be sent as a digital code after you let up the key. At our PD, our portable radios emit a "squawk" that has the individual officer's name encoded which reads out on our radio computer screen. This makes it easier for us to tell which officer just called in. The same thing could be implemented with CB's, with an LCD readout on the front panel reading the ID of the transmitting station. The digital signal could be encoded with the user's callsign.

This is only a pipe dream, because there are numerous problems with it. First, there are thousands upon thousands of CB's out there already without the ID code, so not everybody would be ID'ing. Secondly, if you sell your radio to someone else, they'll have to get the ID changed. If they don't, they'll be transmitting your ID. You wouldn't want this if they were breaking the rules.

I'm sure I could come up with a dozen other problems as well.

thing to do you may add.

Some of you have this one track mind
obsessing on law and rules
****
>yes your cry's of breaking ISP rules LOL
>while breaking them

I don;t cry about it. I do what y'all taught me to do....report to the
ISP when they are violating the rules. If I broke ISP rules, they would
terminate my account. Webtv is infamous for not giving warnings, just
terminating the account.
****

>yes your inclined to break even more it is >called lawless.
.

Again, you may wish to familairize yourself with webtv's policies so as
not to appear so ignorant in the future.

..never saw so many
****
>you need to get out more often Junior<

Again, the flattery.

>.... it is amazing what you can see if you open >your eyes.

I keep telling them that.

power-hungry, power trippers gathered in one place all at one time...
****

>quite amazing isn't it Super Bowl Channel 6 is >where alot of them congregate,

No. Your type can't hang there..this is more your speed right there.

>but there are others.<

pretty cool trick,
****

>Yes it is, sorta like David Blaine<

You lost me.

this thing we got going with cb.
****
>Yes it is illegal correct?<

Attracting these few subordinate and substandard malignant power hungry impotent hammies to a cb forum? No, it's not illegal, just enlightening to the rest of the hammie community, as it illustrates all that is wrong with hammie radio today.

>Exactly not for Ham use see we at least agree >on his motive

But the clipped clarifiers and frequency counters sure as heck aren't made for cb.
****
>Au Contriare oh twisted soul they are Export >radios made for Cbers in other countries,

You are self-contradicting. You have already claimed they are targeted at American cbers.
Beginning to sound more and more like Dave Hall,,,y'all take turns with the ornithological diet these days?

>Cbers don't use frequency counters? Or >ssbers don't use open clarifiers?

Who claimed they didn't use them? You did, not I. I claimed such features aren't made for cb.

That type behavior ruined a few
mad-hammers around here.
****
>Yes, I am sure when the FCC got a hold of >them it did ruin em.

Dunno. Never checked the FCC archives to see if Dvae or Lelnad or Fank or Adair was ever popped...it doesn't concern me, but it certainly wouldn't surprise me in the least.

>I agree they don't like the intrusions on 10 >meters

Who are you agreeing with?

Anyone with the proper business can sell hammie radios...one needn't
even be a hammie.
****
>No one said differently he was told to buy from >a reputable "Ham'
dealer, I know the word >reputable
>and you are strangers

Not at all.
My refusal to allow those such as yourself to dictate what constitutes
"reputable" is merely but another in a long line of what plagues and
bewilders you.

>but buying from cb web page gurus online or >buying from a reputable
storefront who sells >FCC approved radios. If there is so much >money to
be made and they are allowed to be >sold and used by hams, why doesn't
HRO or >AES , Burkhardt, etc etc or any Big Ham >dealer sell these
radios?

Money? No one said anything if the such except you. One topic at a
time...it gives you room to focus.

>you say Hams can use em legally Answer me >that Batman.

Answer you WHAT?
You didn't ask anything.

>They are a front for the Xforce line of amps.<

Galaxy radios? Who conked you on the head?

> In fact Carriage
>Car@aol.com wash who used to post here >has become one of the owners.
>Amazing the info you find out in these CB >forums LOL

And this upsets or pleasures you why?

>Why, of course<

But....why?

>You don't feel that way?<

I find my pleasures not at the expense of others.

"Live and learn."
****
*
>Back to Movie trivia huh, it was "Live and let >die" James Bond

Who sang the original theme song?
Paul McCartney (I think).
Anyhooo...you are getting your posts confused again. I didn't say "Live and Learn".

He can use it on ssb
****
>He sure can, but that was never really even >mentioned.

Sure it was...by me in retort to your false claim that a hammie couldn't use it legally.

---
and that's where all the 10 meter activity is..

>28.085 yep those damn truckers, thats exactly >where one of those Galaxy radios will put him.

What do truckers have to do with anything concerning us?
You still seem to be confused about the law. You definitely are incorrect concerning useage of a Galaxy radio by a hammie.

****
>you are misinformed on many things my >friend,

Actually, I'm not, hence you and the dog-ladies attacking me personally and not my posts. You effectively reiterate that point on a daily basis along with Lelnad and Hall.

>what a hammie can use is the least of your >worries.

I have no worries. I just enjoy pointing out your lies.

>Don't sweat it it is on a need
>to know basis and you really don't need to >know.

Then why did you bother to bring it up?I suggest a refresher course in radio law. Maybe Herry will take pity on you and perform the Heimlich on you for that crow you are asphyxiating on :)

>your captains license?<

Hahhhaa......it only took you, what....almost 4 years? Maybe in 4 more you can actually narrow it down to the few thousand on this coast.

****
>where are you heading this time not North I >hope? too cold

I get north once a year or so these days.
Even went through your neck of the woods a few years ago...played in

Lancaster, did the Amish buggy ride, ate at Zinn's on 30...

****
>Is that where we will find you?<

Yea, I'll go back there..good food.

> LOL To the batcave!<

It's good you revel in fantasy. It helps those in doubt understand your posts.

"maybe the ARRL"
****
>Thinking of becoming a member?<

Maybe I already am.

Jerry will spell it out
****
>I thought he did last week for you, hmm you >still don't understand?

(chuckle)
You illustrated perfectly you not only don't understand, but incorrectly interpreted what Jerry said. He never claimed what you attributed him. At least you don't limit your lies about cbers by misattributing what they say..you extend that courtesy to your fellow hammies, as well.

how many manufacturers of hammie rigs can you name that currently are made here in the US besides Ten-Tec..hmm?
****
>Any of the licensed hams in the usa can build >there own. Do I win a prize?

Maybe.......if you can answer the question.

Building a rig doesn't constitute manufacturing. There. Now you have two erroneous claims that you can educate yourself on.

Actually you don't need to build in an id, every transmitter has a
distinctive pattern to the leading and trailing edge of the
waveform when keyed that can be identified just like a 'finger
print'. The FCC has used this to identify illegal transmitters.

: And according to their level of effort and dedication to the hobby,
: they are rewarded with additional operating privileges.

Nope, has nothing to do with "effort and dedication".

Hang around here long enough, and you will see someone write
something like:

" A really tough written test would surely separate those
who really have an interest in the hobby.", or..

" Other, more relevant, methods can establish an applicant's
dedication to the service.", or..

" I think it is effective at minimizing the undesirables.",
or..

" ..... the key to maintaining the quality of hamming is
making it something to work for.", or..
.
"My opinion is that any obstacle you put in the way to any
achievement guarantees that only those with dedication and
strong interest will get there."

All of the above quotations, gathered from recent threads, were
made by serious and well-intentioned licensees who want the best
for the Amateur Radio Service.

All of the above quotations also completely miss the mark, in
that they suggest that the examination process is the key to
ensuring that "the right kind of people" (those who are
"worthy") become licensed and, by extension, that "the wrong
kind of people" get filtered out.

First, the testing procedure is an "entrance" exam, not a
"graduation" exam.

Second, while "interest", "dedication", and "hard work" might
be hallmarks of good amateurs, the FCC and ITU regulations

do not specify levels of interest, dedication, hard work or other measures of "worthiness" as requisites for a license. Therefore it is not the function of the examination process to determine (even if it could) if an applicant is "worthy" but rather to determine if he/she is QUALIFIED to use the spectrum assigned. There should be no "dumbing down", but neither can there be a requirement that the examination process screens out applicants who lack "commitment".

Don't get me wrong here, folks. I believe that the examination process ought to be rigorous enough to determine proper knowledge and skills so that a new licensee does not inadvertently trash the bands, hurt themselves, or harm other users/uses of the spectrum. I am not even suggesting that Morse testing is a "good thing" or a "poor idea". But I have no expectation that ANY examination can filter out "unworthy" applicants who lack the proper dedication or motivation.

Even if it could, who then would become the arbiter of "worthy"?

Besides, it's the Advanced and extras that cause the majority of deliberate rules violations. A tech or General might mess up, but an extra knows better and does it anyway. And how much effort should you have to put into a hobby?? Do the CW worshippers and "I hadto take a REAL test" guys have a life other than radio and are they still working? A lot of them are retired, sick and seem like they resent any changes because a new ham might not have to "go through what they did". I'm not married, but I have a full time job, other hobbies and interests, friends, pets, etc. How much of those do I have to ignore/abandon to be "worthy" to them?

A lot of people get turned off just by listening to some of the nonsense that goes on the air, and some get turned off after they get a no code ticket, and are ignored, trashed, ridiculed, talked over, etc by older hams, almost always of 20+ years experience, and almost always they seem to be Extras. If anyone should have their "plug pulled", it should be these guys. They have no excuses. The most local incident I can remember was when several hams in Detroit purposely interfered with anyone who tried to use the repeater having a call issued after the NO code was introed. This went on for some time, then they must have gotten some kind of warning, since it just suddenly stopped. AS a victim of these guys, I think something more should have been done. Andyes, I did make a complaint, complete with tapes of their nonsense.

BDK, no more CW for me, finally, it's over..

Here's a novel idea. Let's have Extra band segments, Newbie band
segments, no-code band segments, code-only band segments and a
Dont-even-bother-with-getting-a-license segment.

Oh wait...we already have that.

-Bill M

The only way this could happen to a no code tech is on a repeater (unless
he is operating out of class on another band - and then he *should* be
ignored or otherwise enticed to cease transmitting).

But basing you opinions on a very limited segment of the hobby (repeaters)
is very misleading. Repeaters (especially in larger metro areas) are often
abused by all license classes, and many "old timers" think of them as
something akin to licensed CB anyway. Try working simplex or SSB instead,
you'll find a very different group of hams.

In this day and age, requiring folks to do code is
pure bullshit. Do we ask computer science majors to
write code in assembly language or know DOS?

HELL NO!

Unfortunately, the ham radio community is so far behind
the times that these guys don't even know what day it is.

Give your favorite ham radio operator a dixie cup and
string, b/c that's where he or she is from a technological
point of view.

The ham radio community will continue to shrink unless
it gets its collective heads out of its asses.

Hey guys, it is 2002

I'll disprove yours Twisted.

> Being a ham doesn't offer any of the above with the exception to
more
> spectrum.

I would like to see CBers run fast scan TV on 11m. Never mind the fact that a single channel takes about 6 MHz of spectrum. However there is more than enough room on just the Ham 70cm band alone, 30 MHz wide, to run several channels.

http://www.detroitatvrepeater.com/

I don't hear about any CBers doing EME, moon bounce, work. The antenna array below is designed for 30 db gain on 2m.

http://web.wt.net/~w5un/
http://df6na.mayn.de/~df6na/w5un.htm

Cbers can't launch and use their own PRIVATE fleet of communication satellites either.

http://www.amsat.org/
http://www.amsat-dl.org/journal/adlj-p3d.htm

I'll also bet CBers don't get to talk to the space shuttle or International Space Station Astronauts either. I'll bet you didn't know that just about every Astronaut that has been or currently is on the International Space Station is a licensed Ham Radio operator.

http://sarex.gsfc.nasa.gov/

Poor CBers are stuck using wimpy slow packet, and illegally too. Don't like the snail pace of 300 baud, or 1200 baud. Hams get to use high speed digital communications up to whatever limit their equipment is designed to handle. Some goes as fast as 10 Mbs. Oh yeah we run TCP/IP too. And we don't have to put up with a bunch of crybaby CBers E-mailing ISP's about TOS agreements. It's a nice private network without them.

http://www.tapr.org/
http://www.grapes.org/

How about experimental applications like Spread Spectrum and Digital
Voice. I don't see any CBers doing it.

http://www.tapr.org/tapr/html/ssf.html
http://www.chbrain.dircon.co.uk/dvhf.html

I could go on listing more, but I've made enough of a fool out of you
Twisted for the present moment.

How many of them are currently making rf amplifiers like the
example..? How many, if any current rf amplifier manufactures use a
specific sequence relay in their circuits..?

The answer is close to if not zero... back ye heathen with
thy dated technology. Chase ye not windmills in this here land.

> >A relay "Sequencing" notation seems to be missing from the circuit

> you don't.

Remember mr off topic.... the original amplifier circuit in question has
one relay.

Other than you gassy cloud sequence story, can you provide any
modern rf amplifier circuit using a sequence relay... or any mention
of bending relay armature contacts or using said type of relays in
their respective parts/owners manual.

Why is it not widely mentioned in modern manuals and text books..?

> >Your bent armatures suggestion is bad news.
>
> Such "bad news" that the practice has been used by almost every
> manufacturer of transceivers since they were invented? Right. Uh-huh.
> Ok. Next you are probably going to proclaim that relays are "dated
> technology". Sure thing, Skippy. Whatever you say.

The subject was a simple rf amplifier circuit... you just want to dance
the night away on off topic poop again.

In regards to transceivers... rather than the stupid practice of hosing
relay contacts... Motorola, GE, RCA and EF Johnson (along with most
other mfgrs) simply delayed the RF long enough for the antenna relay
to transfer.

If you ever had your face in any of their manuals, you'd see delayed
A+ and A- functions doing the task. Hey, what a concept..! In
specific, see "channel element ground" functions.

Yeah, cranking on relay armatures is pretty bad news... especially
since many of them are sealed reed relay types. But you knew that
and obviously holding back to see if I'd mention it... yeah right.!

Hard to crank on a reed relay when its sealed. Yeah baby..!

> >> And the real issue with the relay in that amp is the fact that there

This looks a lot like what is being referred to now as a SDR -
software defined radio. All you need for hardware is the front end
stuff to get the signal down to a low enough IF to be digitized. And a
back end, up converter and amplifier, to transmit the signal generated
by the DSP section. Nice link by the way too.

Being a ham doesn't offer any of the above with the exception to more spectrum. One can operate all the modes one wishes on 11, they work just as well on 11 as they do 10. Some run as much power as they wish.

>Except you can do all that on the ham band >and know you are doing it legally.

Yup,,it sure is..until that dial is turned and y'all come down to the freeband and try to be heard 'cause there ain't much hapening on 10.

>Who is y'all?<

Hammies that freeband.

>I never do that,<

So you say.

>can you be more specific?<

Sure....I COULD.....but I won't.....,...and the reason is exactly the same as you use for not posting your call.

>You see I obey the rules. <

So you claim.

About the only disagreement we had was over the Tech License issue. His view was Tech's if they don't upgrade don't learn, which is not true. What socked him was finding out that Techs really do design equipment etc. and don't spend all day yacking on their 2m HT. He could never bring himself around to admit it. That was too bad.

The only reason IMHO many Hams push the code test issue is its the only currently testable skill you can't cheat on during testing. The written exams are a complete joke. Anybody with a yellow high-liter and a few weekends can easily memorize enough of the question pool to pass any of the exams, and still not know a thing. I passed the Tech exam on a bet from somebody who claimed they would pay the exam fee if I passed. I never even studied for it.

"JJ, just ignore him."
(snip)

Yea, JJ...just ignore me. If you ignore me, you may not check my claims
about Dick McCollum being the one to bust Lelnad's azz for forging me in
a hammie room. There is your KC8LDO contribution to hammie radio. He
couldn't hold his salt in here debating me so he took to forging me in a
hammie room and was caught by one of his own who had the best interest
of radio at heart. He never got over it. I do believe the term "yellow"
applies here..matter of fact, it was the term applied to Lelnad in a
hammie room for his games.

Prove it. That's all you have to do is prove I posted those notices.
Get the posting logs from the ISP(s). Do the dynamic IP address traces
required. The dates and time must match exactly to within a few
seconds. And finally get the ISP to verifiy in writing the address in
use at that time was assigned to my account on that day and at that
time. Think you can do that Twisted? Get going times a'wasting. If not
then go in the corner and play with your squirt flower some more. I
don't have time to waste on pepole who can't prove anything.

Yeah, it was on 2 meters. This doesn't happen a lot like it did back 10
years ago, but it still happens, and it's always veteran hams that do it,
not no code techs or anyone recently licensed.
>

HAhahahahaha! The fact that you feel this an accomplishment that somehow says something about you is ghastly ironic. It speaks volumes, but not the way you think it comes across. No wonder you and Dave HAll get on so well. You not only espouse the same incorreect bullshit and share the same ridiculous lies, but you both enjoy namecalling, attacking, taking pleasure in others dilemmas, and you both are largely incapable of seeing any other view but what your tunnel vision allows. Entertainment is derived from allowing you both the freedom to put forth an image you wish to project to the world.

So, in effect, you have never experienced anything beyond basic entry level operation? That's not much scope of experience to be basing such a negative view of the hobby on.

Since you claim to have passed the 5 WPM element in the past, all you have to do is show proof of it to the examiner when you take your General (or higher) written element and you will have your HF ticket. Isn't that what you wanted, elevated privileges without having to take the code test?

2209. Increased activity above 28mhz

Newsgroup: rec.radio.cb
Date: 2002-11-23 00:25:41 UTC
From: Kenneth <pwrguy@intergrafix.net>
Message-ID: <uttimje6kqvb19@corp.supernews.com>
Source record: 144738

I was surprised by the increase in trucker activity above 28mhz until I visited the trucking newsgroup. Way to go Voob!
Voob posted his thoughts in the trucking newsgroup and while we hear know him the trucking comunity didn't....untill now:)
Now truckers who never touched the band selector on thier Galaxy radios are going high and daring Hams and the FCC to do something. With just a few keystrokes voob managed to inflame hundreds if not thousands of truckers and made the situation 10 times worse.
Good one:)!!!!!!!!
Sincerely
Ken

Machine code is the lowest level code, when you write in machine
language you are coding directly in the language the machine
understands. An example of a high level language is BASIC which is
written using English, such as GOTO, IF, THEN, LET A = B, PRINT,
ect. The high level language either uses an interpreter, which
converts the high level code to machine language on the fly, or it
is compiled which converts the high level code to machine language
in an executable file (.exe).

One of the biggest justifications for Ham radio licensing is
for emergency operations. It is MUCH MUCH more likely for
radiotelephone to be of immediate use (other than post-WWIII situations)
than code.

Code should be encouraged for those who like that medium, but
technical competency is much more important in general (esp for
high power operation.)

Lots of NCT's like fm simplex as much as the next guy. Some even use
other modes such as SSB, packet, and even CW. Why must the rudeness
only take place on repeaters? Have you never been to a club meeting
where it takes place in person?

> But basing you opinions on a very limited segment of the hobby (repeaters)

Your comments are very limited and misleading. I've heard noisy
elitists at the Dayton Hamvention where they don't care who they
offend.

Limited again. But a hotspot of rudeness. I witnessed a 2by2 with
the first name Curtis berating a new ham's first QSO on the air - on a
St Louis repeater. Apalling.

Sure, I used to be a ham... (probably before alot of these readers
where born.) Had the code and everything. Additionally,
the rules and regulations were easy... The technical part was trivial
(even as a highschooler, I didn't have to study that.) Sure, my First
Phone was a little more difficult, but still technically easy (the rules and regulations
were much more difficult.) I also had NO BENEFIT of tutoring, but
simply learn and understand very quickly (still do.) There is NO EXCUSE
for IRRESPONSIBLY avoiding the demand of technical competency,
because it is the tool used to support responsible behavior on the
shared airwaves.

Learning an anachronistic and rather less useful skill, like code is mostly
a waste of a newbies time (unless they *want* to use code.) For
typical emergency situations (nowadays), radiotelephone will be much
more useful. Trying to be elitist based upon an anachronism, has mostly
the effect of creating an exclusive club and creating a barrier in the wrong
place. If anything, the barrier MUST be on the basis of being able to
operate competently (including technical competency.)

It is good that code has been dropped on the above HF frequencies, but
even HF rules could stand some revisiting by the international organizations.

For those who claim that I might need to learn something, it would be
good to learn some respect for those who have 'been there, done that.' I
do have some problems with certain fine motor skills. The problem isnt'
any better since I was young. It isn't a handicap, but the anachronism
and simple waste of time for any operation that I would be interested in
is a serious disincentive (rather than the appropriate disincentive against
technical incompetency.)

It was good to hear that ham radio is starting to realize that they need
to look towards the future, rather than try to create a false elitism based

upon an anachronistic skill. If the elitism is based upon a currently (or future) strongly useful expertise, then there is some value. Ham radio does need to continue to self-police, but also appear to be friendly.

John

Good example: I wrote/re-wrote a significant amount of FreeBSD (the VM
code and other pieces.) Without knowing and being able to use assembly
or machine code, it would be a severe handicap for some groups of programmers.
However, there is usually an intimate relationship between machine code
and the code produced by high level languages. Understanding this relationship
and being able to exploit it can sometimes help to improve system performance.

Of course, technical knowhow, and the ability to solve communications
problems (e.g. interference, path loss issues, reliability), are MUCH MORE
important nowadays to render code to be a quaint curiosity.

I don't know where you've been, but there are people using assembly language today (2002). And it is for major companies, and leading edge products. Not all programming is Java and OO. Don't assume that one specific method of programming/language useless until you understand the reason for using it.

Also, don't assume that one method for transmission is inappropriate for all communications. Some operators prefer voice, some prefer code, that is their choice.

Code can be thought of as a requirement so that operators have sufficient breadth in their understanding of radio communication. Isn't testing about comprehension and proficiency. These result in the privilege to operate a radio.

(I wouldn't hire a programmer that doesn't know assembly.)

To me it is clear that code is a viable part of the hobby. When I no longer hear code in the HF bands, I may consider it to be obsolete. Since people are using it today (2002) it clearly isn't obsolete.

On the other hand arguing about this is rather pointless.

Later,

Craig

More than you think, Skippy. Any good designer of common-cathode
tetrode/pentode amps will add a sequenced relay specifically to make
sure the screen is last-on-first-off (when the screen supply is
seperate from the plate supply).

>> >A relay "Sequencing" notation seems to be missing from the circuit

>
>Remember mr off topic.... the original amplifier circuit in question has
>one relay.

I never said it wasn't, Skippy. I guess I have to rephrase this a
third time so you can understand it: Adding extra gap to a pair of
contacts in a relay (by slightly bending the amrature) has the same
effect as using two sequenced relays.

>Other than you gassy cloud sequence story, can you provide any
>modern rf amplifier circuit using a sequence relay...

I'm willing to bet that the amplifier in question does.

> or any mention
>of bending relay armature contacts or using said type of relays in
>their respective parts/owners manual.

You probably won't see such a notation in any owner's or service manuals since these relays are typically ordered from the manufacturer with the specified gap (or 'contact delay' -- same thing). All you get from a service manual is the replacement part number. Replacing one of these with a general-purpose relay -without- checking the contact gaps on the original can lead to some serious trouble (and I learned THAT one from experience).

>Why is it not widely mentioned in modern manuals and text books..?

Sequential relay circuits ARE mentioned in many manuals and text books, even in the ARRL manuals. It's up to the designer to choose how best to implement the circuit.

>> >Your bent armatures suggestion is bad news.
>>

Why are they "bad news", Skippy? And if they are "bad news", why have they been used for decades?

>In regards to transceivers... rather than the stupid practice of hosing
>relay contacts... Motorola, GE, RCA and EF Johnson (along with most
>other mfgrs) simply delayed the RF long enough for the antenna relay
>to transfer.
>
>If you ever had your face in any of their manuals, you'd see delayed
>A+ and A- functions doing the task. Hey, what a concept..! In
>specific, see "channel element ground" functions.

Those are common practices with diode switching circuits. Sequential relays accomplish the same thing, and when a relay is going to be used in the circuit it's much easier to gap a pair of contacts than it is to construct a power line delay circuit (which usually won't provide for the disconnection of the RF final before it powers down, burning out the relay contacts before their time).

To verify my statements, all you need to do is to find an old radio that uses a T/R relay, take off the cover and look at the gaps. If you don't have an example of your own, email me your address and I'll send you a whole box full of old T/R relays from a wide variety of radios that use gapped contacts. Some of them have bent armatures and some of them have armature spacers, but all of them were built with the same objective -- a sequential relay.

>Yeah, cranking on relay armatures is pretty bad news... especially
>since many of them are sealed reed relay types. But you knew that
>and obviously holding back to see if I'd mention it... yeah right.!
>
>Hard to crank on a reed relay when its sealed. Yeah baby..!

Reed relays don't carry RF very well. And they certainly don't carry
power because it tends to vaporize the Hg and destroy the relay. They
are usually only used for low-voltage DC and audio switching. But you
knew that, didn't you Skippy?

>> >> And the real issue with the relay in that amp is the fact that there

>Just leave out the equalization networks...

I have had several discussions with Brian on many of the issues he
raised with this amp, including the use of a single relay. He was
right on the money with everything he said and I don't think he should
have stopped when he did. He has learned good information from those
discussions, although I didn't think he ever would at the time. You
should follow his example, Skippy.

Some of you must be new to CB. The ID built-in to the radios was tried in the 70s and the human rights people fought it and won. The ID could be in the form of a sub-audible tone series. I do think that they should bring back the licenses for CB and that way they can go to the radio conferences and say, "we have XXXX numbers of CBers" in a cetin state or country and protect the band from being sold off. Now they have no way of knowing how many CBs are out their and active. Lets face it, it was the number of licenses that got us the expansion from 23 to 40 in 1977.

LMAO!!! Now George is trying to be Scott, man what
this person will do for attention. Aaron, all you need to do

see what he's posted, no matter when or where he posts, it is always in an accusatory, harassing, foul language fashion, so he'll whine away, but he is a troll and hates having the light shined on him, you can tell by the way he changes screen nics <G>

Landshark

Yes, this is pretty much how computer languages evolved. Assembly language is still used today mostly in the development of high level languages (C, VB, Java, etc.) and operating systems, because as each new processor hits the market, they have their own instruction set.

BTW, there is a difference between assembly and machine language. Machine language is that which is understood by the computer - the 1s and 0s. If you had to write and debug a program using only 1s and 0's, you'd soon become frustrated after trying to debug the first couple lines of code. Assembly is the next step up from machine language. It uses alphanumeric representations of the 1s and 0s that the computer uses, and a compilier converts them to the machine language that the computer understands.

Steps to better Amateur Radio
1. Get rid of the word "Ham"
2. Get rid of excess codewords.
3. Discourage cults such as Wouff Hong
4. Encourage Amateurs to not have their lives revolve around "Hamming".
5. Encourage Amateurs to lose weight.
6. Get more females, young people into Amateur radio.

7. Get rid of QST and bring back Ham Radio magazine
(but change the name to Amateur Radio magazine).
8. Get more people involved in: Homebrewing, radio direction finding,
troubleshooting, use of test equipment, antenna building.

9. Positive publicity - positive publicity spots in newspapers, etc.
Endorsements by celebrities, Amateur radio in movies.
10. More clout with politicians.
11. Stress educational benefits, such as geography, etc.
12. Collaboration with EE education and IEEE, not separation from them.
13. Real development activities through Amateur radio clubs.
14. Real tests of viability of certain modes by getting large numbers of people
to test them.
(Could be done in a contest).

15. Get rid of the Morse code requirement.
16. Encourage an adequate number of coders - but don't tie this to the license
classes.
17. Morse certificate for 5 wpm, Morse with distinction for 13wpm

18. Real license preparation classes to understand the material.
19. Non-question pool format for written tests.
20. Call the license classes Novice, Intermediate, Advanced instead of
Technician, General, Extra
(Clearer terminology and more respectful of achievement).
21. Simpler "Operator" class that does not include practical circuits.
(I bet with a more difficult test, many coders will end up here instead
of Extras).

22. Real Emergency communications training,
(must demonstrate on actual equipment), instead of just written test.
23. Field day preparation meetings so everyone can do their best on field day.

24. More real skill building activities
25. New awards. Instead of WAS and other volume based awards, recognition for
WAB(Worked All Bands), Distance awards, station setup time awards, etc.

Some one had better know how to write in assembly language. You do need to develop ever advancing compilers etc and that may take some assembly language programming even today.

Ah, yes. But those of you who advocate "self-policing" are the very ones who
take it upon yourselves to sometimes play "net cop" while you titter and
tatter about the poor operating procedures of others. This is, in itself, a
form of elitism in that a minority of ops willingly choose to castigate
others for operating procedures with which they do not agree. Beware of
"self-policing" and the resultant criticism of other ops...this, in the eyes
of many, has not the appearance of being friendly.
So far it would appear that "self-policing" is but a nice feel-good idea
with little merit and zero results.

> between the processor (machine language) and the operator??
>
Machine code, and the textual representation of machine code: assembly language
are the lowest normal level of programming (ignore microcode, etc.) The
ultimate output of compilers and assemblers is the machine code. There are other
ways of making computers do what you want also, including 'interpreters' and/or
'emulators'.

One first creates a bunch of 'source files' that contain the program instructions
(in high level language or in assembly code), and then apply the source files to
a compile/linkage process, or directly execute the program using an 'interpreter'.
Interpreter programs can either 'execute' the code directly upon parsing (reading)
the program statements, or can create an internal version (or somewhere in
between.) In the case of compile/link-type systems, they produce a program that
can be run directly on the computer under specific operating systems that support
I/O and other functions. The simplest forms of Java are a hybrid, where you
compile the source files, but you run a program that interprets the psuedo-machine
code as if it is a real processor (well, sort of...)

There are more than I list, but off the top, I can think of at least these four methods
of 'making computers do what you want':

1) Compiler/Assembler/Linker:
These take a higher level language (assembler is slightly higher level than
machine code from a representational standpoint) than machine code, and
produce runnable machine code. This is like using Microsoft-C or MASM,
linking the output with libraries, and produce an EXE file for NT/2000. A
similar thing is normally done on Unix.

2) Traditional interpreter:
The MS Basic interpreter that Billy and friend wrote would directly execute
the text of a program, but reparsing and executing the code statement by statement.

3) Less traditional interpreter:
AFAIR, Perl creates a compiled copy of at least a part of the program, but the
'compiled' output is an internal representation that is used as a set of instructions
for software.

4) P-Code compiler/interpreter
Java and the old UCSD P-System on a PDP11 uses an explicit compiler to
produce a file that is similar to machine instructions. The difference is that the
'machine instructions' are actually created for a formally defined software

interpreter for those instructions. In some cases, Java performance has been improved so that during the 'interpretation' of those virtual instructions, native (real) machine code is made available for future execution in a given running of a program. Even further, it is possible to 'compile' those Java virtual machine instructions into an EXE-type file that would be normally directly created by a Microsoft-C or Unix-C compiler and linkage process.

So, I hope this helps to clarify, but probably is 'too much' from the standpoint starting from scratch.

John

I agree that there is at least one 'Barney Fife' in every organization. However, it is
better that Ham radio be self-policed than to have the FCC crack down only against
things that they politically don't like. If ham radio is allowed to be a cesspool of
people who violate conventions, but technically obey the law enough to stay under
the FCCs radar, then that would diminish the hobby. I am not familiar anymore with
the ARRL guidelines, but there should certainly be some guidelines so that the 'net-police'
or the
'ham-police' people who have a little too much zeal can be helped back to
more reasonable attitudes. The various conventions and rules of etiquette need to
be taken seriously, and I seem to remember that even when I got my license a long
time ago that there were such 'conventions.'

It is much better that reasonable guidelines be instituted, and strong suggestions
be made in the guidelines that the spectrum is to be shared amongst HROs
according to the law and conventions. If there aren't reasonable guidelines, and/or
intolerant people who seem to emotionally need to be snobs, then the self
policing will sometimes fail. Frankly, from what I have heard, the current scheme
seems to work okay, but there'll always be those people with too much zeal!!! :-(.

People do tend to be cliquish, and I have made various such mistakes in
previous situations. It is important that the 'elders' avoid become
condescending or turn into control freaks.

I don't mean to compare hams with other community radio service participants, but I remember my Dad talking about various groups believing that they 'own' certain CB channels (this was back in the 'Convoy' days). It is sadly odd, if not almost funny to think that someone is so diluded into thinking that they can have dominion over a resource like that. Again, times have probably changed a little on CB, and I am not making that complaint about amateur radio (I am just seriously thinking about ham again), but even good people can become petit and cliquish in situations that lend themselves to that kind of behavior.

I really believe in ham radio as a great hobby for kids of all ages (including those who are retired :-)). Computers are great (and I am a very serious computer person), but I'd like to see ham radio compete for alot of the mindshare directed towards the CREATIVE parts of the computer hobby... (I am NOT confusing the computer WWW addict with the real computer hobby of developing tools and applications that do interesting things.)

Hopefully, I'll have collected enough info in the next week or so to be able to embark on a new hobby...

John

You've found the key word...HOBBY. Its not a job or political position
and and if its a PITA you can (and should) just walk away and do
something else. No need to hang out on a repeater/club/band/newsgroup
if the general attitude there is such that aggravates you and takes away
from the enjoyment. No rocket science and no Morse code unless you want
it that way.
Good luck,
Bill WX4A

I do agree with that. It would be good if the unecessary cost of entry to HF
'Morse code' could be removed (limited by treaty) however.

My interest in technical competence for HROs is based upon being able to
responsibly deal with and understand problems dealing with more than low
power transmitters. With high power comes more responsibility for local
interference and occupation of spectrum space.

I don't see a problem with Ham radio having a pure communicator class
license, where there is little or no technical or code qualification. However,
that class of operators should be limited to purchased gear at low power on
VHF/UHF.

Well, like I said, I haven't figured out all of the little details. I guess both parties would be required to fill out a form, paper or online, whenever there's a change of ownership. This way you couldn't have others filling out forms saying you sold your rig or they sold their's to you. I'd also like to see the timers built into CBs that are currently in amatuer radio (as I understand...not a ham) to stop dead-keyers. Definitely would like to raise the legal power output also, variable...this would satisfy those who swear by 4 watts. I'll think of more, but these are my major changes I'd like to see.

Why would someone actually BELIEVE that a SOFTWARE trojan horse (virus) can be intalled in a ANALOG piece of equipment???

I am an Electronics Technican and the only actual concern for a CB, is that the manufacturer can (and likely will) FILTER the CB freqs applied to the Linear Amp, making it not useful.

If you want real power ! Get your Amateur Radio License ! It is EASY and you have MUCH MORE POWER and 1000% better equipment to use.
Up to 1500 watts of LEGAL transmit power ! Actually TALK to people, not listen to static and rude abnoxious people !!!

If you have questions about Amateur Radio licensing, e-mail me direct and I will help you all I can.

And this upsets or pleasures you why?

>Why, of course<

But....why?

>You don't feel that way?<

I find my pleasures not at the expense of others.
****
Yes at your own hands right. Self gratification I think they call that.

"Live and learn."
****
*
>Back to Movie trivia huh, it was "Live and let >die" James Bond

Who sang the original theme song?
Paul McCartney (I think).
Anyhooo...you are getting your posts confused again. I didn't say "Live
and Learn".

He can use it on ssb
****
>He sure can, but that was never really even >mentioned.

Sure it was...by me in retort to your false claim that a hammie couldn't
use it legally.
****
he can't you just can accept that fact.

----
and that's where all the 10 meter activity is..

>28.085 yep those damn truckers, thats exactly >where one of those
Galaxy radios will put him.

What do truckers have to do with anything concerning us?
You still seem to be confused about the law. You definitely are
incorrect concerning useage of a Galaxy radio by a hammie.

****
>you are misinformed on many things my >friend,

Actually, I'm not, hence you and the dog-ladies attacking me personally
and not my posts. You effectively reiterate that point on a daily basis
along with Lelnad and Hall.

>what a hammie can use is the least of your >worries.

I have no worries. I just enjoy pointing out your lies.

>Don't sweat it it is on a need
>to know basis and you really don't need to >know.

Then why did you bother to bring it up?I suggest a refresher course in
radio law. Maybe Herry will take pity on you and perform the Heimlich on
you for that crow you are asphyxiating on :)

>your captains license?<

Hahhhaa......it only took you, what....almost 4 years? Maybe in 4 more
you can actually narrow it down to the few thousand on this coast.

****
>where are you heading this time not North I >hope? too cold

I get north once a year or so these days.
Even went through your neck of the woods a few years ago...played in
Lancaster, did the Amish buggy ride, ate at Zinn's on 30...

****
>Is that where we will find you?<

Yea, I'll go back there..good food.

> LOL To the batcave!<

It's good you revel in fantasy. It helps those in doubt understand your
posts.

"maybe the ARRL"
****
>Thinking of becoming a member?<

Maybe I already am.

Jerry will spell it out
****
>I thought he did last week for you, hmm you >still don't understand?

(chuckle)
You illustrated perfectly you not only don't understand, but incorrectly
interpreted what Jerry said. He never claimed what you attributed him.
At least you don't limit your lies about cbers by misattributing what
they say..you extend that courtesy to your fellow hammies, as well.

how many manufacturers of hammie rigs can you name that currently are
made here in the US besides Ten-Tec..hmm?
****
>Any of the licensed hams in the usa can build >there own. Do I win a
prize?

Maybe.......if you can answer the question.

Building a rig doesn't constitute manufacturing. There. Now you have two
erroneous claims that you can educate yourself on.

VHF/UHF seems to be the experimenter's playground these days and the intl treaty doesn't prevent >30MHz licensing without code. HF will be sticky forever. You can work around the world with a watt on HF, and so can the garbage spouting out of an improperly operated rig, so the potential remains for interference to commercial services and thats why the Treaty is such as it is. Its not an argument that I'm going to try to hold my own on, however. I recall that Japan went to a 'communicator' license scheme back in the 70s-80s and no-coders were given privileges up to 20 watts on HF or something like that. The bands didn't turn into a zoo-like cacophony of echoes and roger-beeps. Maybe in Japan it did...I wouldn't know.

>
> I don't see a problem with Ham radio having a pure communicator class

> VHF/UHF.

Well, with any drastic change like doing this on HF, there has to be some enforcement mechanism or else the existing rowdy ranks from 26-28 MHz have a real potential to screw things up for everybody on all bands. The FCC got out of the ham bizness many years ago when they turned over 'licensing' to the ARRL. The only time they even bother with enforcement of the Amateur Radio Service is when some nut goes berserk on 75 meters or a repeater and generates a ton of specific complaints. I don't think they want to go back to the patrolling mode like in the old days where if you said s**t on the air you'd automatically get an FCC notice (and a dozen ARRL OO notices)...and I don't think anybody wants to see that. But opening up HF would require such vigilence and we would all pay the price.

Bottom line is that- 1) 5 wpm ain't all that tough and 2) outsiders looking in to the amateur radio service don't necessarily have the same perspective of those already inside. Pity that it translates into a we vs. them scenario but thats human nature.

I've taught code classes with a hometown club and its very clear that some people simply can't master it but would be 'good' hams nonetheless. I'm not going to speculate about mental blocks and all that but I can

vouch for the ones that would jump up in the middle of a code-practice session and yell out "I ain't puttin' up with this s**t" and storm out of the room, yet 9-year-old kids were able to pass muster. I don't think they'd behave that way at the Driver's License office, so yeah, there's some level of committment that makes getting into the hobby something to work at, even if it may seem archaic. These same 'examples' are the same ones that will also piss and moan about putting their real name and address on a FCC License Application form.

There's a framework in place that allows most anybody whose knuckles don't drag the ground to get a ham radio license. The people who can't accomplish this...well, go figure.

> and plugged it into 110 VAC....Mo Power!

He would not be the first...

I had a neighbour who took the red and black leads from his mobile CB radio
and connected a 3 pin mains plug.
Yep... he connected it direct to 240 Volts AC.

Yeeee-har.
Apart from a popped protection diode... and a new hairstyle, nothing
spectacular happened.

Another bad mistake I saw, was a homebase radio where the mains
side had been messed with. Someone had taken the mains from the
transformer primary... and connected it direct to the main 12 Volt
supply line.
The person said that they had just purchased it from another CBer. They
had seen it working, but went out, got the money, and returned to buy
the radio. I think they got "done".
Not much was left working... with no protection diode in these sets, it
had cooked the PLL, RF output, RF drive, EPROM, etc. They just
had to write it off.

Regards,

Peter.

According to Sparkles, my reference to "Tubes" was an
admission of law breaking. He didn't stop to consider that,
in the UK, the word "tubes" is used to refer to CRTs... the
devices in amplifiers are called "Valves" or Thermionic
Valves" here in the UK.

From my Collins English Dictionary...
Tube: Electronics See Cathode-ray tube.
No mention of amplifying devices.

So, I think we should allow the legal system to decide
what is an "admission of guilt", not some SELF
APPOINTED "Antikey Clown".

I have a new "nic" for you... "Skippy".
Fitting for someone running a Kangaroo Court.

> > that I am likely to never use.
>
> Actually learning all about DSP is useless as it's built into the radio and
> I don't have to do anything.

Wrong.
If you knew about DSP, you could easily hook up the radio to your laptop
and program, for instance, a scan mode that stops only on the "voice"
channels, and not simply where the signal is strong.
You could build your own noise-reducing filters.
You could get a programmable radio (Ten Tec?), and modify the firmware.

What you are saying is a bit like saying: Hey, I don't need to
know how to solder, my radio comes already soldered.

The fact is that more and more of the radio receiver functions in the
future will be done digitally. There are two main reasons:
it's more flexible, and it is easier and more repeatable
to manufacture digital ICs than analog ones.
In cell phones, in cordless phones, everywhere that radio
technology matters, digital is more and more used.
If you refuse to learn digital signal processing, pretty soon you will
understand about 5% of how a receiver works; the rest will be digital.
Of course, you will still be able to use code on archaic equipment,
but amateur radio should look forward, not backward.

Peter

Amateur Radio Newsline™ Report 1318 – November 15, 2002

Amateur Radio Newsline report number 1318 with a release date of Friday, November 15, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. Ham radio is a lifeline after tornadoes hit on Sunday November 10th. Find out the details on Amateur Radio Newsline report number 1318 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HAM RADIO AND THE NOVEMBER 10th TORNADOES

Ham radio is called out after a series of tornadoes hit in several states east of the Continental divide. Thirty-five are confirmed dead. Damage is in the tens of millions. And ham radio becomes a life-line when all other communications fail. We start our coverage with Amateur Radio Newsline's David Black, KB4KCH, in our South-East bureau not far from one of the areas hardest hit:
--

For Alabama, the night of November 10th is one for the record books. The small town of Carbon Hill was devastated. Ten people were killed there, and damage was extensive following two tornadoes--one of them, an F3 that cut a path of destruction measuring 46 miles. In all, 12 people died in Alabama.

Two counties away from Carbon Hill, amateur radio operators were on duty at the Weather Service's Birmingham Forecast Office, where forecasters were issuing a total of 46 Tornado Warnings. The ham radio group that works with the Weather Service is called the Alabama Emergency Response Team, or ALERT. Chuck Arthur, KF4SSX, is ALERT's President:

--
Arthur: "It was very busy. We had four of our members down there from 4 p.m. until after 2 a.m. and we were busy the entire time we were down there"
--

At one point, more than half a dozen Alabama counties--stretching from eastern Tennessee to eastern Mississippi--were all under Tornado Warnings at the same time.

--
Arthur: "We are able to talk to all of the different storm-spotter nets across North Alabama and of coarse the National Weather Service coverage area and receive reports of damage, tornado touch-downs, hail and all of the important pertinent things that the Weather Service is interested in"

--

Arthur says emergency communications were conducted on VHF and UHF frequencies:

--
Arthur: “The storms came in from the South-West and moved all the way up through the North-East corner of the state three or four times in a row. We had multiple counties under tornado warnings at the same time so it makes it very busy”
--

To the north, Tennessee was slammed hard by killer twisters, too. 17 deaths were reported statewide, making the outbreak one of Tennessee's deadliest. President Bush declared 16 Tennessee counties disaster areas. From Louisiana to Pennsylvania, 88 tornadoes were reported.

Another community hit hard was Van Wert, a town in western Ohio. Fred Vobbe, W8HDU, of the DX Audio Service is in nearby Lima Ohio has that part of the story.

--
NOTE: DAVE BLACK TOSSES TO FRED VOBBE IN OHIO
--

Sunday was cool and quiet, but when storms racing across Indiana quickly it heated up the amateur community in Van Wert, Ohio. The call for amateur assistance came as Van Wert Ohio E.M.A. Director Rick McCoy, operating the Van Wert Amateur Radio Club's W8FY, alerted hams to an approaching storm.

The storm spawned one tornado in the community of Berne, Indiana, but by the time the storm arrived in Van Wert there were reports of as many as four separate funnels.

Listening to ham traffic on the 146.850 repeater and public service channels was like listening to an attack from enemy. Call after call relayed the fact that there were tornadoes on the ground. Homes, businesses, and even a large power feeder tower buckled and fell to the ground as the winds from the F4 tornadoes tore up the once pristine countryside.

The initial storm spotters tracked the storm system as it entered Van Wert county, and then exited into Putnam County where it then hit Continental, Ohio. Later the storm touched down again in Huron and Sandusky Counties on the south shore of Lake Erie.

At one point a ham radio operator solemnly reported assistance as he came across a fatal. Hams assisted in pulling people out of homes that were flattened. Four people died, two in Putnam, and two in Van Wert County. The death toll in west central Ohio could have been higher had spotters, and the Van Wert County E.M.A., not worked cooperatively together. Hams reported to the Van Wert E.M.A. and an alert system used by the county which warned a group of school kids who escaped from a theater just seconds before it was reduced to rubble, leaving a small Toyota in row one. Citizens had as much as 28 minutes to prepare for the storm due to the efforts of hams

Ham involvement did not stop with spotting. Again, working with the Van Wert County E.M.A., hams assisted in damage assessment, helped in local shelters, located downed power lines, kept traffic and the curious out of devastated areas, and assisted police, fire, and EMTS operators with communications. Some hams stayed through the night manning communication centers, which helped authorities concentrate on the task of finding the missing, and assessing the damage.

The storm was compared to the April 3rd, 1974, tornado in Xenia, Ohio, where 33 lost their lives. Had it not been for ham radio operators working closely with authorities the death toll in Van Wert and Putnam would have been much higher.

In west central Ohio, I'm Fred Vobbe, W8HDU, reporting for Newsline
--

You can see some of the damage from the storm at Fred's web site, www.vobbe.net/weather.

And one last thought: The tornadoes of November 11th are another reminder of the way a disaster can occur at any place and at any time. And when there is no other way to communicate ham radio is always ready to step in. (ARNewsline™)

**

RADIO HORROR: AMATEUR OPERATOR MURDERED IN GAMBIA

A United Kingdom ham has been killed while on vacation. And as Jeramy Boot, G4NJH, tells us, it appears as if he was the victim of a rather violent crime.

--
Ron Ford, G3NKO, has been murdered while visiting the Gambia. Ron, from Waterlooville in Hampshire, had built his own holiday accommodation in the Gambia, from where he operated as C56RF.

His body was found at the end of October and has been brought home for burial. It is thought that Ron was the victim of a robbery and the circumstances of the murder are now being investigated by officers of the Metropolitan Police.

Ron was an active member of the Royal Signals Amateur Radio Society, and was a regular check-in on the RSARS international net on 20-meters SSB from the Gambia. He had also held a number of other DX calls, including MP4BFH in Bahrain, MP4TBV from theTrucial States, VS2FN in Malaya and VS9AFR from Aden.

Jeramy Boot, G4NJH.
--

As we go to air there has been no word from Gambian officials on where its investigation of this crime is leading. (GB2RS)

**

RADIO SECURITY: BE CAREFUL WHAT YOU SAY ON THE AIR

Use discretion an the air and help defeat the terrorists. That’s the sub title of Bill Sexton’s MARS column appearing in the December issue of

Worldradio Magazine. And in it, Sexton, who holds the call N1IN says that American’s now face a new concern over the indiscreet transmission of material that my seem harmless but which could be used against us by a terrorist enemy.

By way of example, Sexton cites the well published airline schedules that were used by al-Queda terrorists to coordinate their September 11th attacks on New York and Washington. This is material still available on every airlines website.

Sexton says that we all must all be concerned with what the military calls Operational Security or OPSEC. And he indicates that it is very important for hams to consider what they are saying on the air because you can never tell who listening in. And he says that even the most seemingly innocuous tidbits of information, monitored by hostile ears are probably being handed on to the enemy’s intelligence analysts in the hope it will reveal some weakness or secret that can be used against us.

Sexton covers quite a bit about domestic security and how you can do your part. You will find it beginning on page 50 of the December issue of Worldradio Magazine. More information is on the web at www.wr6wr.com. (Worldradio)

SPECTRUM POLICY: FCC CHAIRMAN WANTS TO REVAMP THE NATIONS RF AIRWAVES

The government's top communications regulator wants to revamp the nation's current policy on use of the public the airwaves. Bill Pasternak, WA6ITF, has the details:

--
Federal Communications Commission Chairman Michael Powell says that he rejects the notion that there is not enough spectrum to go around for those who want it. And the FCC leader is proposing an almost total overhaul of the nations telecommunications policy involving radio frequencies used for everything from television broadcasts to wireless Internet devices and everything in-between.

Powell says he hopes technology and new FCC policies will take advantage of all empty and underused spectrum, possibly by using time sharing techniques. He says that recent tests conducted by his agency in five major U-S cities show that there are many under utilized spectral parcels available for sharing. This is especially true when some frequencies are used only at certain times of the day and are otherwise left empty.

What is evident is that the FCC is looking at ways to better utilize every hertz from D-C to light and beyond. And if a mandatory sharing of most spectrum is put in place there’s a good chance that all hobby and personal radio -- including ham radio -- will be sharing in some future yet to be established all-digital domain.

For the Amateur Radio Newsline, Bill Pasternak, WA6ITF.

--

The frequency bands referred to by Chairman Powell were not detailed in the news release. (Various FCC and other news releases)

**

SPECTRUM POLICY: AUSTRALIA ISSUES PAPER ON SPECTRUM USE

The United States is not the only place where spectrum use and bandspace is an issue. It’s also under study in Australia where Q-News Trevor Tague, VK4BAT, tells us what the Australian Communications Agency is doing:

--
The ACA has prepared a Discussion Paper outlining a range of issues relating to the operation of spectrum licensing and posing some questions for discussion.

The paper does not attempt to present the ACA's assessment of these issues but rather aims to provide a starting point for industry debate about the effectiveness of the spectrum licensing concept in the light of experience since its implementation in Australia some five years ago.

Trevor Tague, VK4BAT, reporting for Q-News.
--

The Australian Communications Agency is soliciting input on this matter from the citizens of V-K. (Q-News)

**

HAM RADIO EDUCATION: THE BIG PROJECT KEEPS GETTING BIGGER

Back here in the United States, the December issue of QST will feature an article on the American Radio Relay League’s Education and Technology program better known as “The Big Project”. And, according to an Internet posting to QRZed dot com by League President Jim Haynie, W5JBP, the program which got off the ground late last year grew to 26 schools in 2002.

When President Haynie proposed this project to the League’s Board of Directors, he said that it should be funded by donations, not dues. That’s exactly what has happened and he now says that he is gratified at the results to date.

W5JBP says that the Amateur Radio community has sent a loud and strong message that this is something that they want. He adds -- and we quote: “I, and the entire ARRL organization want to thank you for that support.”

At least 14 more schools are lined up to join the Big Project in 2003. The full text of Jim Hayne’s posting is at www.qrz.com. (Adapted from QRZ.COM)

**

ENFORCEMENT: WASHINGTON LAW NAILS SPAMMER

An Oregon man was ordered to pay nearly $100,000 in the first case brought under Washington state’s tough law against "spam" e-mails. Attorney General Christine Gregoire's office estimates that 28 year old Jason Heckel of Salem, sent as many as 20,000 unsolicited e-mails to Washington residents in 1998, trying to sell a $39.95 booklet called "How to Profit from the Internet."

The case was the first brought after the Legislature banned commercial e-mail with misleading information in the subject line, invalid reply addresses or disguised paths of transmission. Judge Douglass North ordered Heckel to pay a $2,000 fine and more than $94,000 in legal fees.

Heckel didn't appear in court. His lawyer Dale Crandall said he plans to appeal, Crandall says that state anti-spam laws violate the U.S. Constitution's protection of interstate commerce. (Published news reports)

**

ENFORCEMENT: OHIO HAM AGREES TO VOLUNTARY SUSPENSION

An Ohio ham has agreed to a voluntary one year suspension of his operating privileges. This after the FCC accused him of interfering with a Cincinnati area repeater system. The FCC’s Daryl Duckworth, NN0W, explains:

--
Duckworth: “The Enfocement Bureau, by agreement, imposed a one year suspension on Gary R. Weiler, KI8DI, for interference to the K8CLA repeater system in Cincinnatti. The interference occurred in March.”
--

Back in September the FCC sent Weiler a Warning Notice that alleged on several occasions he had deliberately interfered with the K8CLA repeater. That system is operated by the Cincinnati Amateur Radio Club which the FCC says assisted in tracing the interference to Weiler. By agreeing to the one year suspension Weiler avoided harsher enforcement action that could have included a hefty fine and the possible revocation of his amateur license. (FCC)

**

REPEATER COORDINATION: METROCOR SAYS COORDINATION IS BACK IN NNJ-NYC-LI

Repeater coordination appears to have returned in and around the New York City area appears. This with word that MetroCor has issued its first coordination documents on October 24th to repeater systems that have had no changes from their prior coordination.

This marks the first time for any organization to issue any coordination documents within the area since the collapse of the Tri-State Amateur Repeater Council several years ago. All repeaters in the New York City, Northern New Jersey and Long Island New York areas are being asked to file with MetroCor by

December 1st so that it can meet the submission date deadlines of the various repeater directories.

More information and necessary documents are in cyberspace at www.qsl.net/metrocor. (MetroCor)

**

RADIO LAW: COURT STRIKES DOWN DESCRIPTIVE VIDEO FOR THE BLIND

Bad news for the visually impaired. A Federal appeals court says that the FCC overstepped its authority in ordering broadcaster to provide descriptive video to accommodate the blind. Amateur Radio Newsline's Bruce Tennant, K6PZW, reports:

--
On Friday, November 8th the U.S. Court of Appeals for the District of Columbia Circuit threw out Federal Communications Commission rules requiring television programs to include these oral descriptions of the action on the screen. In rendering its decision, the court said that Congress did not give the FCC the power to order the creation of this service.

The court maintained that Congress only authorized and ordered the commission to produce a report on how best to accommodate the needs of the visually impaired. Nothing more and nothing less. And that it definitely did not direct the agency to create a federal mandate that a descriptive audio service be made mandatory.

Under video description, a narrator describes the action during natural pauses between dialogue. The description is available on the secondary or SAP audio channel which is usually used for second language broadcasting.

The Motion Picture Association of America had challenged the rules in court. It claimed that the FCC was not authorized to issue them. Now, the U.S. Court of Appeals for the District of Columbia Circuit says that it agrees.

For the Amateur Radio Newsline, I'm, Bruce Tennant, K6PZW, in Los Angeles.
--

Blind advocacy groups are criticizing the court decision. They say its a setback for those who are visually impaired. (Published reports)

BREAK 2

This is ham radio news for today's radio amateur. From the United States of America, We are the Amateur Radio Newsline with links to the world from our only official website at www.arnewsline.org.

**

HAM RADIO BUSINESS: KENWOOD TO RESTRUCTURE

Some big changes at a company considered one of ham radios “big three. Ken Butler, W1NNR, tells about the news coming from Kenwood:

--
Kenwood Corporation is merging five U.S. based subsidiaries. As part of the restructuring, Kenwood will combine home and car audio marketer Kenwood U-S-A, its repair company Kenwood Service, Kenwood Communications and Kenwood Systems with their parent Kenwood Americas. The merged entity will simply be called Kenwood.

As part of the merger, Kenwood will expand its U.S. based home and car audio engineering team. The communications business which includes Amateur Radio products will continue to maintain its own sales and marketing staff. The consolidation won't shut down any offices or warehouses and the company plans to add people in an engineering capacity.

Ken Butler, W1NNR.
--

The changes here in the United States are a are part of a total Kenwood corporate restructuring announced earlier this year. (ARNewsline™ from press release)

**

OUR HERITAGE: KFBK AT AGE 80

Former Amateur Radio Newsline reporter Ross Du Clair, WA6VWY, passes along word that Sacramento California radio station has made history. This, as KFBK-AM 1530 celebrates its 80th birthday this month.

Ross is the Chief Engineer for several stations including KFBK. He says that his station began as the broadcast arm of McClatchy Newspapers in February of 1922. McClatchy is best known as the publisher of the Sacramento Bee.

Today KFBK is owned by Clear Channel Communications, of Austin, Texas. Over the years, KFBK engineers contributed many innovations to the radio broadcast industry. This includes the creation of the Ampliphase Modulation system adopted by RCA.

The station officially celebrated its "birthday" Friday 8 November 2002 at the Sacramento Hyatt Regency. The legendary Rush Limbaugh was to be the guest of honor. Limbaugh began his meteoric rise in talk radio from the studios of KFBK. (WA6VWY)

**

HAM RADIO IN SPACE: ISS EXPEDITION 6 ARE ALL HAMS

The new ISS Expedition 6 crew are all of licensed radio amateurs. They are U-S Astronauts Ken Bowersox KD5JBP and Don Pettit KD5MDT. Leading the team is Russian Cosmonaut Nikolai Budarin R-V3FB.

The launch of Space Shuttle Endeavour was planned for November 11th. It was halted only minutes before liftoff when a small oxygen leak was detected. A new launch date is tentatively set for Monday November 18th.

The STS-113 flight of Space Shuttle Endeavour is scheduled as an 11-day mission. During the seven days the shuttle will be docked to the Station, three spacewalks will be performed in addition to delivering the new crew. (AMSAT)

**

HAM RADIO IN SPACE: THE LEONID METEORS ARE COMING

Sky & Telescope magazine reports the Leonid meteor shower is due to sweep across Earth during the early morning hours of Tuesday, November 19th. If the weather is clear, we could be in for a grand celestial show. And many meteor scatter enthusiasts are expected to be on the air attempting to make contact by bounding signals off the ionized meteor tails as they burn up in the planets atmosphere. (Various sources)

**

INTERNATIONAL - CANADA: RAC VP RESIGNS

Radio Amateurs of Canada has announced the resignation of is First Vice President Joe MacPherson. MacPherson cited irreconcilable interpersonal differences with some members of the Board of Directors as the reason for his reason to stand down from the RAC Executive. A replacement for MacPherson will be named within next few weeks. (RAC)

**

CONTESTS

Turning to the contest calendar, word that the Bulgarian L Z DX contest begins at 12:00 U-T-C on Saturday November 16th and runs for 24 hours. This is a C-W only event taking place on 80 through 10 meters. The approved contest exchange is an R-S-T report and your I-T-U Zone. (GB2RS)

**

DX

In D-X, word that OH0Z on Aland Island will be active during the November 23rd to the 24th CQ WW CW Contest. He will be operating in the single operator, all band category. QSLs via Ari Korhonen, OH5DX, at his callbook address. (GB2RS)

And KX7YT is active on 10, 15 and 20 meters SSB and PSK31 as S-21-Y-V from Bangladesh. He will be there through the 4th of December. Q-S-L this one as directed on the air. (Modern DX)

Higher in frequency, the GB3VHF 144 MHz propagation beacon was removed from service on November 2nd for maintenance and was expected to be for one week. (RSGB)

And the GB3BUX 50 MHz beacon has suffered antenna damage due to storms a couple of weekends ago. It is currently running at reduced capability as a result. Its sponsor says that repairs will be made as time and weather conditions permit. (RSGB)

**

THAT FINAL ITEM: FCC HONORS WORLD WAR II COMANCHE CODE TALKERS

About a year ago Amateur Radio Newsline told you about a very special group of Native Americans who’s linguistic ability made battlefield communications secure during World War II. Now, the Federal Communications Commission has taken the time to honor this group for id dedication to our nation. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the rest of the story:

--
The Comanche Code Talkers were members of a specialized communications unit of the U.S. Army 4th Signal Corps. And using their ancestral Comanche language they created an unbreakable code used by Allied Forces on the battlefields of Europe. Now, decades later our own Federal Communications Commission has paused to honor this group of Native Americans for their meritorious service to our nation.

Charles Chibitty of Tulsa, Oklahoma was the FCC's guest of honor at the recent ceremony. He told how he and 16 other young men, who had grown up together and were all members of the Comanche Tribe of Oklahoma, used the Comanche language and their Army communications skills to create a military intelligence code that was never broken by the enemy.

Even more interesting, Chibitty also shared anecdotes from their enlistment and training. He explained that they even had to create Comanche code words for "bomber" and "tank." These are words that did not exist in the Comanche language.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.
--

Chibitty is a decorated veteran and the last surviving member of the 16 Comanche Code Talkers. You can read more at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-228074A1.doc (CGC Communicator, FCC)

2266. That FCC prude has got to go

Newsgroup: rec.radio.cb
Date: 2002-11-23 15:22:21 UTC
From: witchdoc@attbi.com
Message-ID: <3aed93cc.0211230722.49f5d089@posting.google.com>
Source record: 144805

Heard from 2 separate news stations that some stuffed shirt at the FCC (it wasn't Riley: he knows better) has gotten a bug up his ass about bits of entertainment slipping through the Commission's "indecency" definitions. Apparently this came about as a result of some soft-porn lingerie promo aired by Victoria's Secret, but the old duffer's crackfart unfortunately calls ALL harmless stuff into question (cusswords, violence, sex, pics of dead bodies). Maybe he is not only a prude, but a closet flamer to boot...

I don't know about you, but I happen to enjoy hearing words like "shit" and "fuck" on PBS & KCOP, & to see people on camera occasionally give the Finger. The only bad thing is that it diminishes their insult power somewhat. Nudity? It wouldn't bother me or anyone else I know to turn on the TV and see "Flesh Gordon" airing.

Forget making the case that the no-obscenity jive is "for the children"... I can show you a nextdoor neighbor who talks like a sailor, yells at his wife, etc., and their 13-yo daughter never talks like him. I watched porn films during my early teens, and I never turned into a lech.

I say, therefore, that the TV folks should just go on cussing and screw the legal stuff, after all they're not threatening anybody (causing angina attacks in old folks, MAYBE). Riley would agree with me on this. Because like it or not, that FCC shit-disturber is just another Don Quixote jousting at windmills, if he thinks he can get everyone else to turn the airwaves into Mr. Rogers' neighborhood. (Well, I take that back... maybe antikeyclowns want this to be Mr. Rogers' neighborhood. But even their martyr-like efforts are probably not going to be able to stop the "obscenity" juggernaut. Waaah.) Amen.

Please direct all rubout/malicious prosecution threats to my e-mail address... in the meantime, KEEP ON CUSSIN'!!! >:-P

I agree that 5wpm isn't all that tough for many people, but learning technical
competency with a REAL technical exam would be a better allocation of time
for newbies. Exclusive clubs based upon anachronisms isn't helpful. Exclusive
clubs based upon competency, public service and even creating a larger
'technical' gene pool isn't a perfect thing, but much more socially justifiable than
'secret handshakes' like Morse code.

John

And that's like saying "I only want to learn what I want to learn for my license test, and that doesn't include Morse code, even though it is a requirement".

> The fact is that more and more of the radio receiver functions in the
> future will be done digitally.

Only *some* receivers. Generally built in factories by electronic professionals, not your average homebrewing ham. Yes, those receivers are marvelous. And demanding of advanced technical skills not found in the general amateur radio population, nor likely to be found there in the future where testing requirements don't demand such skill and knowledge. That's to be expected since only a small portion of hams are professionals who have that advanced training and skill. Far more are skilled at such "archaic" but very effective communications modes as radiotelegraphy. Many of those hams also are users of advanced digital modes, but few are trained in the development of those modes. Most are just happy to be users of them. That doesn't mean there are no technical skills among the general ham population. It DOES mean that technical skills among hams are far more likely to lie in other than the latest djgjtal technology. I don't see that changing as long as simple tests are all that are required for entry into ham radio.
While new hams who are serious about learning to engage in their newfound pursuits, few have the background to leap onto the digital design bandwagon. I believe fact that will forestall any great amount of digital design work by hams other than the smaller portion of the hobby who are already so engaged.

There are two main reasons:
> it's more flexible, and it is easier and more repeatable
> to manufacture digital ICs than analog ones.
> In cell phones, in cordless phones, everywhere that radio
> technology matters, digital is more and more used.

The operative term here is "used". Hams are more and more users of advanced technology and less and less designers. Most design by ordinary hams is at a level of technology below digital design using advanced ICs. I can't imagine why this should be surprising to anyone. Bu it always seems to bring forth dire predictions for the demise of the ARS

because of it. Won't happen. Our future is far more dependent on our emergency communications capabilities, and that demands little or no digital design skill.

> If you refuse to learn digital signal processing, pretty soon you will
> understand about 5% of how a receiver works; the rest will be digital.

Only the design of the newest receivers. Pure digital radio is still far in the future, save a niche element which is normal for advancement in the field. Analog radio is far from being ill, and very far from dying.

> Of course, you will still be able to use code on archaic equipment,
> but amateur radio should look forward, not backward.

That's your opinion, shared only by other similarly situated technical types. Most of us hams believe we should look both forward *and" backward. We have a great heritage and most of us won't forget where we came from and how we got here as we move into the future.

They are not and never have been our governing body. They are merely the
largest ORGNIZED group of amateurs. Thus we can have some clout in the
political arena and get heard by government policy makers.

Note that ARRL did not "take over" testing duties. There are many VECs
accepted by the FCC. All the VEC organizations have to meet with each other
on a regular basis and agree to each question pool, how often that pool is
changed, whether it is multiple choice, etc. If ARRL had "taken over,"
they would be in sole control of the testing. They are not. There is W%YI,
SANDARC, and a half a dozen or more other organizations.

I've been a ham for 50 years and an engineer for 43 years and
I still can't solder a PL-259 to RG-213.

Even a signed confession sometimes isn't
proof enough for a conviction in a court of law.

Landshark

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

I was being sarcastic and trying to point out that the same argument can be used for anything that a person doesn't want to learn. Personally I happen to think that there should be more basics included in testing. For example, I think every ham should have to demonstrate that they can solder a connector to a coax successfully. However they don't have become soldering experts.

Check Your Stats:

On a per capita basis, the ham radio community is shrinking and going nowhere. And on a per capita basis, Japan has twice as many ham radio operators as the United States.

The ham radio community is 50 years behind the times by holding on to this code thing.

The ham radio community has a very negative public image, so women and young people wouldn't take part in a hobby that's dominated by semingly bunch of old farts totally lacking in basic social skills.

Would you want to spend a Saturday evening having dinner with a ham radio operator?

I don't think so!

Hey guys, it is 2002, not 1952.

That description of the Code fits the outsider viewpoint exactly. I'd
guess that more than half of the new 5 word-per-minuters cannot copy 5
wpm so there's hardly a secret society mentality. Last I remember the
code test was a multiple choice thing that doesn't even require solid copy.
So in some regards the code test is simply a 'trial by fire' and in
reality has been degraded so much as to be moot.
In the meantime, if int'l law says it must be done that way then I guess
one has to comply until it changes if you want to get on HF.

There's NO WAY IN HECK that this bastard Anderson
could have hid out for so long, without the help
and assistance of the so-called "patriot" community.

Perhaps the FED's and FCC ought to pay more attention
to a certain ham radio "Patriot's Net" (3.860 8PM EST),
since numerous transmissions and topics (by licenced and
unlicenced stations) were heard while monitoring this net
over the course of the past 2 weeks - and these topics
seemed to be *very concerned* on "activity" the same area of
N.C. where Anderson was caught yesterday. Coincidence??

Good job America's Most wanted. Good job BATF.
Good job and help by the ADL and Mark Pitcavage.

One down - MORE to go....

http://www.courier-journal.com/localnews/2002/11/23/ke112302s318493.htm

A tip received by ''America's Most Wanted'' and forwarded to federal
officials
led to the arrest of Kentucky fugitive Steve Anderson in rural
Cherokee County, N.C., yesterday, authorities said.

Anderson, a white supremacist who operated an illegal radio station
from his Pulaski County home, had been at large since allegedly
shooting at a Bell County sheriff's deputy on Oct. 14, 2001.
He was arrested in the mountains of southwestern North Carolina
by the Bureau of Alcohol, Tobacco and Firearms and the North
Carolina State Bureau of Investigation.

''It's a relief he's been taken into custody, especially without
incident,'' said Don York of the ATF's Louisville office.
York said the ATF captured Anderson entering a
residence, but he declined to elaborate.
Anderson was being held last night in Asheville, N.C.,
pending his transfer to Kentucky, authorities said.

York said the television program received a tip about Anderson's
whereabouts after airing its second segment on him about a month
ago. The tip was forwarded to the ATF, which worked the case
with North Carolina authorities.

Anderson is accused of shooting an automatic weapon at
Officer Scott Elder, who had pulled Anderson's truck over north
of Middlesboro for a traffic violation. Elder was unharmed after

Anderson allegedly opened fire, although his cruiser was struck about 25 times.

Police said Anderson then drove into the mountains, and a search of his property turned up explosives and guns. Anderson had attracted attention in Pulaski County several years ago by playing host to a small Ku Klux Klan rally during which a cross was burned. He also operated a shortwave radio station out of his home, where his commentary against blacks, Jews, immigrants and the federal government drew the attention of the Federal Communications Commission.

The Anti-Defamation League complained to the FCC about Anderson's broadcasts, and the agency eventually rescinded his license. Anderson continued to broadcast despite the FCC action.
Anderson was a member of the Kentucky State Militia, a civilian paramilitary group, until April 2001. The militia said it dismissed Anderson because he refused to shut down his radio operation.

According to the Anti-Defamation League, Anderson also has ties to the Christian Identity Movement, a loosely defined group that claims Jews are the offspring of the devil. Anderson also allegedly threatened an Eastern Kentucky newspaper editor who included him in a series on hate.

The ADL's director of fact-finding, Mark Pitcavage of Columbus, Ohio, said he was glad that Anderson had been caught, ''because he was a dangerous man who had already shot at a police officer and threatened more violence in his radio show. For public safety, it's a good thing.'' Pitcavage said the capture also was gratifying because ''people in militia and extremist groups *admired he wasn't caught*.''

Bell County Sheriff Harold Harbin said: ''It's good news. I knew eventually we'd catch him. It sends a message you can't get away forever.''

Just for the record, Bill, the code test was changed to fill-in the blank.

As a new ham (licenses 13 months -- I sat for all 4 elements at once), my feelings re CW requirements are mixed. It is certainly a key part of the history of radio and our hobby. It is certainly a valid communications mode. My objection to the 5 wpm is that it is basically neither fish nor fowl. Studying to pass a 5 wpm receive only test is not the way to learn code. A valid agreement can be made, in fact, that it is exactly the wrong way to learn code. (At 5 wpm receive only, the best way to pass the test as quickly as possible for many people is to "see" the di dahs in one's mind and translate character by character. If there is a worse way to learn code in a way that building receive speed and learning to send, I can not think of it.

Purely theoretically (treaties and such aside), I would have little problem with a send/receive test at a reasonable minimum speed (10 or the mystical 13 wpm) or eliminating the CW test completely. As currently constituted, the U.S CW test results, I think, in REDUCING interest in learning CW.

Regarding the written tests...
It would help if the VEC group found an educator to review the tests. I haven't looked at the new Extra question pool, but the old one would never pass mustard as a beginning Ed. course Too many of the wrong answers are clearly wrong merely by reading them without any knowledge of radio theory or regulations. Too many of the right answers have an easily memorized pattern. Please note that this is comment in no way addresses WHAT subjects should be in the test nor to what depth - merely a comment on the quality of the questions. That said, I do recognize that writing "good" multiple guess questions is extremely difficult.

Finally (for anyone bored enough to read this far), by far the most difficult task I faced in becoming a ham was learning to solder 259s. One aspect of voice communications I have yet to learn (more accurately "have not been willing to learn") is referring to my self in the first person plural as in "We have been licensed since 19xx and we feed our XX with a YY."

In the early days this was true, but not very much anymore.

Once you have a "high level language" compiler, you can write the next
version in the compiler language; these days mostly C.

Simple example; the GNU C and C++ compilers have been written in C and
C++ for many years now as have most compilers and operating systems.

While assembly is still used somewhat, it is nowhere as pervasive as it
once was.

Its a center fed half wave dipole antenna. The sloped radials are used to get the feedpoint impeadance closer to 50 ohms. Its a good antenna, but you would do better with a 5/8 ground plane.

If you don't want the best (Jay's Interceptor 10K at http://www,a1antennas.com) then get a Maco 5/8.

You will be much happier!

Dino

You must be too young to remember the real reason CB licensing ended.
Like the 55 mph "national" speed limit, it didn't end because Washington was
feeling generous toward the peasantry - but because the peasantry just nearly
all refused to obey it.

Both you and the original poster missed a couple of points. Any amp becomes illegal once you exceed 1500 watts pep output (but is legal if run under that limit). However, amps are **supposed** to require a certain minimum input power to develop full output (not sure, but think it may be 50 watts) - so the amp is illegal. The original poster forgot to include the John Birch Society ;)

Most TV coax is 75 ohm wire. So the answer is No.

50 ohm for a single system

75 ohm for a duel system.

Hope that helps. No question is a dumb question. Sometimes the answers can
get out of hand.

They must have had golden tounges to get the guy to part with it. I've heard some of those old AM rigs on 75m near 3900 Khz to 4000 KHz. Some kave a sound like professional broadcast quality audio.

Contrary to what a few others have posted yes you can use 75 ohm coax
to connect your CB to the antenna. Getting connectors to fit is
another story. However you have to understand that using 75 ohm coax
will automatically give you a 1.5 to 1 SWR even with a perfect 50 ohm
antenna. If the antenna is not exactly 50 ohms your match will further
deteriorate. Some Hams make use of surplus 75 ohm "hard line" used by
the cable TV industry for interconnections at V/UHF. With a perfectly
tuned antenna, which is easy over a small frequency span for weak
signal work, the resulting 1.5 SWR is acceptable.

If you want to get fancy you can build some impedance transformers to
go between 50 and 75 ohms at each end of the coax. That would take
care of the instant 1.5 SWR hit you get for not using them.

It might work. As we know, one can use a quarter wave matching section (two 75 ohm coax cables in parallel yielding 37.5 ohms) to run between a 25 ohm load (two antennas) and a 50 ohm load (the radio). Consider using a quarter wave matching section of one 75 ohm coax. This will bring the impedance up to around 90 or 100 ohms ... now connect another quarter wave matching section - same thing - to the radio. The radio impedance is now brought up to the same point. Connect 'em together and it should work. The simple way is to use a 1/2 wavelength of the 75 ohm coax (don't forget to figure in the velocity factor). If your antenna is 50 ohms resistive, your radio will see a 50 ohm load despite the 75 ohm coax! Coax length DOES matter in this example. A standing wave will exist within the coax, but the SWR meter should show 1 to 1 (assuming the antenna is 50 ohms resistive). Indeed, even if the antenna is not 50 ohms resistive, that magic 1/2 wavelength of coax will reflect the actual impedance to the radio. It should work!
;)

Hi there, Georgie-girl! Still trolling away, I see. What a lamer!!
When will you learn how to spell and use punctuation?

Georgie-girl has used at least two-dozen nics to get around filters
and harrass people. But that's the only reason he has to post in
rec.radio.cb anyhow; to harrass people. Nobody will talk to him on the
ham bands because he's such an @$$!

Hey there, Georgie-girl! Still trolling away, huh? And yet another nic
to add to the killfile. You're definitely a gem among stones,
Georgie-girl.

Why aren't you on theose precious ham bands keeping them free of the
so-called "intruders"? Maybe because nobody will talk to you? TROLL!

>
> On a per capita basis, the ham radio community is shrinking

Not sure that is totally accurate. N2EY can
perhaps add more historic data to answer state the facts.

> and
> going nowhere.

That depends on what any one indivdiual wants
ham radio to be viewed as.

> And on a per capita basis, Japan has twice as
> many ham radio operators as the United States.

That troubles me not at all.

> The ham radio community is 50 years behind the
> times by holding on to this code thing.

Agree 100% if you are talking about the code TEST.
I have no problem with anyone wanting to use code as
a choosen mode.

> The ham radio community has a very negative public image, so women
> and young people wouldn't take part in a hobby that's dominated by
> semingly bunch of old farts totally lacking in basic social skills.

Actually, I think the ham radio community has almost NO
image at all in the minds and perceptions of most people.

> Would you want to spend a Saturday evening having dinner with a
> ham radio operator?

Sure. Hams are, for the most part, normal people like
everyone else. Are there extremists? Sure, but every hobby
has its extremists...be it antique cars, model trains,
or whatever.

> I don't think so!

Why not?

> Hey guys, it is 2002, not 1952.

Agreed....

I don't think so Jim.

> Any amp becomes illegal once you exceed 1500 watts pep output (but is
legal if run under
>that limit).

Hmm, no kidding!

However, amps are **supposed** to require a certain minimum input power to
develop full output

No Jim, that is just to recieve certification, as a ham you don't need
certification of an amp if it is homebuilt I will provide positive proof of
both for you:

PART 97--AMATEUR RADIO SERVICE--Table of Contents

Subpart D--Technical Standards

Sec. 97.317 Standards for certification of external RF power amplifiers.

(a) To receive a grant of certification, the amplifier must satisfy
the spurious emission standards of Sec. 97.307(d) or (e) of this part,
as applicable, when the amplifier is:
(1) Operated at its full output power;
(2) Placed in the ``standby'' or ``off'' positions, but still
connected to the transmitter; and
(3) Driven with at least 50 W mean RF input power (unless higher
drive level is specified.)
(b) To receive a grant of certification, the amplifier must not be
capable of operation on any frequency or frequencies between 24 MHz and

(not sure, but think it may be 50 watts) - so the amp is illegal.
****
The amp is legal for a ham to use. It cannot get certification

PART 97--AMATEUR RADIO SERVICE--Table of Contents

Subpart D--Technical Standards

Sec. 97.315 Certification of external RF power amplifiers.

(a) No more than 1 unit of 1 model of an external RF power amplifier
capable of operation below 144 MHz may be constructed or modified during
any calendar year by an amateur operator for use at a station without a

grant of certification. No amplifier capable of operation below 144 MHz may be constructed or modified by a non-amateur operator without a grant of certification from the FCC.
(b) Any external RF power amplifier or external RF power amplifier kit (see Sec. 2.815 of the FCC Rules), manufactured, imported or modified for use in a station or attached at any station must be certificated for use in the amateur service in accordance with subpart J of part 2 of the FCC Rules. This requirement does not apply if one or more of the following conditions are met:
(1) The amplifier is not capable of operation on frequencies below 144 MHz. For the purpose of this part, an amplifier will be deemed to be incapable of operation below 144 MHz if it is not capable of being easily modified to increase its amplification characteristics below 120 MHz and either:
(i) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 dB or less gain is exhibited at 120 MHz; or
(ii) The amplifier is not capable of amplifying signals below 120 MHz even for brief periods without sustaining permanent damage to its amplification circuitry.
(2) The amplifier was manufactured before April 28, 1978, and has been issued a marketing waiver by the FCC, or the amplifier was purchased before April 28, 1978, by an amateur operator for use at that amateur operator's station.
(3) The amplifier was:
(i) Constructed by the licensee, not from an external RF power amplifier kit, for use at the licensee's station; or
(ii) Modified by the licensee for use at the licensee's station.
(4) The amplifier is sold by an amateur operator to another amateur operator or to a dealer.
(5) The amplifier is purchased in used condition by an equipment dealer from an amateur operator and the amplifier is further sold to another amateur operator for use at that operator's station.
(c) Any external RF power amplifier appearing in the Commission's database as certificated for use in the amateur service may be marketed for use in the amateur service.

Certainly you can.

You'll suffer a 1.5-1 SWR at the rig.
Your antenna may be able to be adjusted to match the line impedance,
otherwise you'll have an impedance mismatch there. 75 ohm coax has
generally lower loss than 50 ohm coax.
4W shouldn't be a problem for RG-6 or similar.

:
: By your definition, perhaps, Georgie-girl. But then you read things
: that aren't there all the time, then whine and cry about them with
: p*ss poor spelling and lousy punctuation.

LOL this is one of your funniest ones Yet Dick head LOL, by my definition
well asswipe I am the one who wrote it so yes it is by my definiton thank
you, now comes the funny shit, you and your buddy are the ones who read
something into not me LOL, then you cry about it and say I whine and cry.
LOL Look at you you stupid Phuqq, you can only cry about grammar and
punctuation what a lame asshole. Is that the best you got? I thought you
were a professional troll? Theuy were your exact words about yourself. would
you care to see it again?

: And you are the diskhead, Mr. rcranus@hotmail.com!

Oh diskhead ouch that hurts, lol you are really not much of a challenge
dickiehead. And all along you claim to be a pro. Jeez. Tim nebo would put
your lites out.

:

:
: I didn't come from there, dimbulb. That's only what you think, IF you
: think at all, which is doubtful given what you post here.

you are not from alt.pirate.radio? hmm

> Why don't people like you ever grow up?

why don't you go fuck yourself dickie head, you need to keep your yapp shut
your nothing but a loser and a troll and you have the nerve to say something
to me. Get bent.

Why aren't you defending your precious amateur frequencies instead of inciting on a CB newsgroup,

For the last time dick breath how come we don't here you oh thats right you have no call.

Two Dozen? in the past two weeks maybe, but it's a
hell of a lot more than that Richard.

Landshark

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

> semingly bunch of old farts totally lacking in basic social skills.

The negative public image stuff--where can we find confirmation of it? The basic social skills part--that can be confirmed where? What kind of socially skilled individuals insults an entire group of people by calling them all "old farts"?

> Would you want to spend a Saturday evening having dinner with a
> ham radio operator?

My wife doesn't seem to mind having Saturday evening dinner with a ham radio operator. The folks who invited us to their home last Saturday evening didn't seem to mind either. I'd think most would rather have dinner with radio amateurs than with rap singers or the Clintons.

> I don't think so!

You don't think what?

> Hey guys, it is 2002, not 1952.

Yeah, and in a couple of months it'll be 2003!

i guess that may be true what if he put 24 volts in it
and it was a 800 watter and he got 1600 watts.
sence the amp was only 800 watter and with 24 volts
maybe that would be legal cause the amp was only
800 watts to start out with

who is that arron a internet guru

knowing assembly makes you a better HLL programmer. a few years ago there was an online "contest" among friends to see who could write the tightest yahoo chat client. i wrote four clients... using compiler BASIC (one allowing inline assembly), C, C++, and MASM. many of the "C-only" guys [you know, the ones who constantly quote the ANSI (or ISO) C standards like they're the constitution] who bragged about how efficient C compilers were and how obsolete assembler is... could not put out tight code. the guy who put out a really nice C client understood both the hardware and how his compiler (VC++) worked. you can learn a lot by using a disassembler on the compiler's output.

i've heard all the excuses of why not to learn assembly: "assembly is not portable"... well do you plan on porting your code? code is often intimately tied to the gui and OSes API (ok POSIX). "it doesn't matter because we have a 2 GHz CPU"... fine, then go use VB instead... and that is exactly what is happening. why? because 80% of boxes run windows and people want it done yesterday. IMO learning C is easy compared to grasping the win32 api.

i like procedural over OOP because it approximates the hardware better... i prefer Dennis to Bjarne and both to Anders. Gosling and Meyer... don't even ask lol. Kemeny and his contribution were brilliant... he wasn't Einstein's math assistant for nothing... i have one BASIC compiler that is quite good. Craig is right: all languages have their place (of course that place might be the trash can j/k). C is very popular (try to find a haskell compiler for a PIC MCU) but for me it's a love/hate thing because assembler was my first language. Java is always being pushed and while it makes sense for some stuff (Servlets/JSP) it's a dog for general apps.

Deb,
Can you use it? Sure, but it won't be the best or
easiest kind of coax to use. Most coax for TV use has
aluminum shielding, which is very hard to solder to.
In most cases it isn't shielded very well either, depending
on the particular kind that you have. In the long run,
you would be better off using almost any kind of 50 ohm
coax.

And what the hell does the type of radio have to do with the original
question???

A dummy load is basically meant to replace the antenna for testing purposes
and is not intended to radiate a signal, so yes you can use a dummy load if
you don't want to talk any further than that guy 2 houses down...

Why not try an indoor antenna then? Wire di-pole perhaps strung up in the
roof or under the eaves?? There are many options, none of which will be as
good as a proper outdoor antenna, but all will be far better than the dummy
load!

Okay don't laugh, but I have a thru-glass CB antenna on my little Jimmy. I only really wanted it for truck-truck communication on off-road trails and it actually works well for that.

The problem is that the SWR reading is around 2.5-3.0, with no obvious way to adjust it. No adjustments at the box, no length adjustments (although I suppose it could be shortened.) Can anything be done short of getting a real antenna or is this all it's got?

Oh yeah, it's a Uniden 520XL CB, and some "highway trucker" antenna or something like that. Thanks guys.

You're going to have real problems here. Being non-repeater, CB is real dependent on having a real good antenna - and I've seen the huge difference a great mag-mount on a car makes over an ordinary full-size mag-mount when fed with a mobile CB. You're just not going to get out much with a radio feeding a very-short antenna without practically any ground plane or counterpoise.

Got a low-height file cabinet? If not, got a kitchen cabinet - and a baking sheet? Get a real good mag-mount mobile antenna - and use that file cabinet or cookie sheet as your "car."

The antenna won't have much to do with the trouble you are having. Try a different radio un-modified and no amp or power microphone. Just be sure that your antenna has a good ground and a low SWR.

Have you tried getting the CB tuned properly??? Unless the antenna is out of tune or there is a major problem with the cable (i.e. co-ax to balanced antenna & no balun) then it sounds unlikely to be an antenna problem as you have tried more than 1 antenna, so I'd look towards the CB before spending more time & money.

Also try a Low Pass Filter at the CB end, use a standard microphone & legal power output. Is the power supply properly filtered & regulated?

Hell, why not jus' get rid of whole 'tenna?? Jus' a darn wast o' space them there 'tennas anyways, aint nuthin' but a straight coathanga.....

One would presume that the antenna manufacturer has added the coil for a valid reason (the exact reasons we will not get into here as I do not want to confuse some people), so I guess getting rid of that coil would be a little like removing the brakes from your car "cause they just add drag and slow it down". Sounds like a darn good idea until you go to use it!!!!

PS - I got rid of dog - its burried out back with the 'tenna!!!

Yeah, I must agree with you. I would have presumed that if he was able (or wanted) to put it in a mobile he wouldn't have asked for alternatives for a base antenna!! Or was that too logical???

Oh well..... ;-)

Outgoing mail is certified Virus Free.

Two peanuts walk into a rather rough bar, not looking for any trouble.
Unfortunately, one was a salted.

** ** ** ** ** ** **

A jump lead walks into a bar.
The barman says "I'll serve you, but don't start anything."

** ** ** ** ** ** **

A sandwich walks into a bar.
The barman says "Sorry we don't serve food in here."

** ** ** ** ** ** **

A dyslexic man walks into a bra.

** ** ** ** ** ** **

A man walks into a bar with a roll of tarmac under his arm and says:
"Pint please, and one for the road."

** ** ** ** ** ** **

Two hydrogen atoms walk into a bar. One says, "I think I've lost an
electron."
The other says, "Are you sure?"
The first replies, "Yes, I'm positive."

** ** ** ** ** ** **

Regards,

Peter.

2376. OT: Doctors and Vets...

Newsgroup: rec.radio.cb
Date: 2002-11-24 09:43:23 UTC
From: Brainbuster <brainbuster@lineone.spamtrap.net>

A man walks into doctor's office.
"What seems to be the problem?" asks the doc.
"It's ... um ... well ... I have five penises." replies the man.
"Blimey!" says the doctor, "How do your trousers fit?"
"Like a glove."

** ** ** ** ** ** **

Man with a strawberry stuck up his bum goes to the doctor.
The Doctor says "I'll give you some cream to put on it."

** ** ** ** ** ** **

A guy walks into the psychiatrist wearing only cling film for shorts.
The shrink says, "Well, I can clearly see you're nuts."

** ** ** ** ** ** **

"Doc, I can't stop singing 'The green, green grass of home'."
"That sounds like Tom Jones syndrome."
"Is it common?"
"Well........It's not unusual........."

** ** ** ** ** ** **

A man takes his Rottweiler to the vet and says "My dog's cross-eyed,
is there anything you can do for him? "
"Well," says the vet, "let's have a look at him" So he picks the dog up and
examines his eyes, then checks his teeth.
Finally, he says "I'm going to have to put him down."
"What? Because he's cross-eyed? "
"No, because he's really heavy"

** ** ** ** ** ** **

A man came round in hospital after a serious accident.
He shouted,"Doctor, doctor, I can't feel my legs!"
The doctor replied,"I know you can't,
I had to amputate your arms"

** ** ** ** ** ** **

Regards,

Peter.

Quite possibly.
There are hoax messages going around about all kinds of mobile 'phone
viruses.

There are some hoaxes listed here...
http://www.trendmicro.com/vinfo/hoaxes/hoax.asp

I have heard some great and crazy false claims form people cliaming to know
what they are talking about.
From the rental TV engineers who, with any repair being free, use the words,
"it's your antenna, Madam" to get out of any repair where there is at least
some picture and sound... to an alarm installer who, when called back to a
new alarm that kept triggering itself said, "It's your electronic equipment
in your house. All electronic equipment has radio waves in it, even when
switched off."... and left.

Regards,

Peter.

> spacing, even with NFM.

We use FM with 10KHz spacing.
It is also a European standard, FM at 10KHz spacing on the same
channels as you use.

With speech, a deviation of 2.5KHz is about the max. before you
get problems with splatter.
The amount of splatter caused can depend upon the voice characteristics
of the user. The trick is to ban older women... only young ladies and men
should be allowed to use it ;~)

"A_Real_CB_Operator" <cb_ops@limacharlie.com> wrote in message
news:XPVC9.18578$NV.356979@news.direcpc.com...
> 1. MANDATE THE LICENSING OF ALL CB OPERATORS - NO EXCEPTIONS, NO
> WHINERS, NO CRY-BABIES AND NO MORE PROBLEMS!!

How would lincensing improve CB, or end all problems?

Here in the UK, CB still requires a licence. We still get little or nothing done for our money. We have no right to protection from inteference of any kind. We still get the idiots, playing music, etc.
The "RIS" does nothing about abuse of the system, unless it causes problems to another service (such as TV) AND the owner of the offended equipment PAYS the "RIS" to come out and deal with it. Oh, and they must also have paid a local dealer to take a look first.

The licence does nothing but gather money for the Government.
And the biggest "cry baby" is the Radiocommunications Agency, who whine about how the cost of running the licence system costs more than the amount collected. While they keep saying that they will drop the licence... they never get around to it.

> 2. ALLOW FM ON CB

We use FM here in the UK.
It works OK, as long as people stick to the deviation level set.
We are still waiting to hear if we will get SSB.

> 3. BAN THE LINEARS!

I thought they were already illegal over there.
You have even tighter rules than the UK on this issue. Here, it is fully legal to buy and sell linears that will operate around the 10Metre band. This means that linears are legally sold in CB shops... "for Amateur use only" - lol.

It is illegal to use them on CB, but proof would be needed.

> 4. ADD ENCRYPTION / DES / CTCSS / PL / SELCAL

The UK rules allow for Selcall as messages to call up other stations.
The units were available, but they never caught on.

CTCSS would be a great "tone squelch" system. The squelch would not be opened by noise.

But, any system designed to allow "private" conversations would be against the very nature of CB radio. The thing I have always liked about CB in this country, is the "community" spirit.

Group conversations, networks, DXing (legal here), "eyeballs", road reports
and other help from fellow CBers, etc.
Make it into a "private radio" system, with everyone having their own code
to protect from listeners... and the best of CB will be gone.

> 5. INCREASE AM AND FM OUTPUT TO 10 WATTS
>
> 6. LCD DISPLAYS INSTEAD OF THE LED CHANNEL /FREQUENCY DISPLAY

This is something for the manufacturers to do.
Some sets in the UK now use LCD display... specially handheld, as it saves
battery power.
It looks better and uses less power, but I do not see it as a major issue.

> 7. ENHANCE THE "R.E.A.C.T." NETWORK!!

Another thing that was started over here in the 80s... never hear of it in
the UK now.

> 8. MANDATE REAL CALLSIGNS ---NOT made-up HANDLES!!

Did you not have that once... then get rid of it with the loss of the
licence?
Please explain how this "improves" CB... apart from making it more like
Amateur Radio, which it is NOT.

> 9. GET OVER IT AND PUT AN END TO THIS STUPID WAR BETWEEN THE AMATEUR
> RADIO COMMUNITY AND THE CB COMMUNITY!!!! ARGUMENT IS FUTILE AND
> POINTLESS!!

I believe that you will find that it is just a few, mainly "old boys", who
have a problem with CB.
As with this newsgroup, a few people can make enough noise to make something
look like a major war.

> 10. GO ON A TALK SHOW AND HAVE AN ALL OUT
> "HOLIER-THAN-THOU WAR" BETWEEN CB'ers AND HAMS!!

I could just imagine that on the Jerry Springer Show.

> 11. ENFORCE THE CB RULES AND REGULATIONS!!!

What is it you want... enforcement when there are complaints, or enforcment
by having officers sat on street corners, monitoring all transmissions for
illegal power or conversation?
Just like traffic police... sat on street corners watching the traffic all
day... on public money.

Over here, they have alway been getting a licence fee, yet still do very
little enforcement.
What kind of licence fee do you think it would take to cover the cost of
policing CB?
Such a cost will do one of two things:
1. Put people off CB, further reducing it's use... and

eventually killing it.
2. Create a large number of "federal criminals", who
refuse to pay such a high cost for something that
was free.

> 12. PUT CB CHANNEL 9 ON FM FOR REAL CB'ers and replace the CB's in Hwy
> Patrol Vehicles and Sheriff's Offices with Better Equipment for clear
> channel comms.
>
> 13. STAFF THE FCC WITH CB'ers AND HAMS WHO KNOW RADIO OPERATIONS AND ARE
> NOT AFRAID TO ENFORCE THE RULES / REGULATIONS ON EITHER BAND!!!

Do you think that many CBers will be willing to go up against their fellow
CBers?
Will they be left with anyone to talk to, when the get labels such as
"snoop", "grass", and worse. That would split CB into two groups, at war
with each other.

To use Amateurs to police CBers would open up an even larger battle between
the two groups. Amateurs would be seriously HATED by CBers for intefering
in their hobby.
And I thought you wanted an end to the "CB vs HAM" war.

> 14. CONFRONT CB VIOLATORS WITH AUTHORITIES PRESENT -instead of
> being a dumbass and getting shot before you can get out of your vehicle to
confront
> the individual in question!!

Is it common for CBers to shoot people?
Is there a serious problem over there with masses of people being shot by
CBers... bigger than the problem with Kids taking a gun to school and
shooting the place up?

> 17. A "Good-Buddy" is NOT a term referring to one's sexual lifestyle!!

Who says it is?
Over here, it has always been a commonly used term for a fellow CBer.

> 18. "Hand" sounds so stupid when talkin' to another cb'er!!

Eh?

> 19. Use RDF equipment to find the jammer or culprit, instead of
> threats to "kick someone's ass" all the time!! (so pathetic!)

Take a lesson from the chap in the film "Citizens Band"... where he ties one
end of a rope to his vehicle, the other to the offender's antenna... and
drives away.
Or, when he smashes up a kid's CB with a bat. The mother appears, is
told.what he did... and says "good".

OK in the films, but do you believe that it is OK to break laws in order to
punish someone else for breaking a law?

> 20. Report ALL Activities Consisting Of :
> <snip>

The agencies involved could get so flooded with calls that they do not have the resources to deal with, that they decide to take measures to reduce the possibility of complaints.
Rather like here in the 80s. The RIS had so little resources that they:
1. published a book, with info on how to stop inteference to your radio / tv.
2. Insisted that you must first contact an electrical dealer to cure it... before you can call the RIS.
3. Placed a charge on all inteference call outs. You had to pay to get action.
4. Listed items that they would NOT deal with in any way, such as telephones, AM radio, baby alarms, etc.

That reduced the amount of people complaining.
Whine too much, and you could find the same thing happen over there.

Pick your battles carefully. Our "RIS" does that... and boasts a 100% conviction rate. If they take someone to court, they know that they will win.

Regards,

Peter.

Hi Stuart.

As you are in the UK, try Knights CB.

There are a few others, I cannot remember URLs... visit my site (link
below), go to the "radio" section, then select the links page.
There are some there.

I agree Doc. I have had to repair more than one radio that has been used on TV Coax. So I just simply say no. To most laymen, that's the easiest thing to do.

I recommend Mini 8, RG58, RG213 to my customers. Handling cable can get a little pricey with the shipping and fuel surcharges. Now, I don't like to put the PL259's on the RG213 or any of the bigger coax. I thought Mini 8 was a God send since we build our own cables. I don't like the pre packaged stuff.

RG8, I'm not familiar with RG6 is that also 50 ohm. See I am still open for information. Probably because I don't like to put those connectors on that big stuff. My poor old fingers don't work like they used to. Typing is a problem some mornings.

We are usually talking about 18 foot runs for trucks. I steer most of my drivers away from the duels. Just too easy to be taken when they are on the road by others. Its expensive to maintain. I don't use RG58 in most cases unless I am repairing a Wilson 1000 and they want the original stuff or splicing a K40 (which I hate to do). I hate splicing coax.

Thanks for the info. Its nice to talk to someone and not see that a helpful suggestion is getting flamed.

Have a wonderful day.

Most of the new hand held CB's are built pretty much the same.

Good performance is dependant on the

1. Antenna
2. Battery source, i.e.: Pack, Cig plug.

Modifiable, now you now that's illegal. Cobra, Midland, Cherokee.

Happy hunting.

Just a footnote. No one. Absolutely no one has ever come in to tell me
they are tickled pink with the performance of their hand held radio. They
have not complained about them either.

Not that I advocate this either, but a lot of our hunting groups are calling
about marine band. That should make the Hams happy. I really try hard to
dissuade them in this decision.

But the groups buy and use the radio's for various tasks out in the woods.

Make sure your SWR is good. And if your radio has had the modulation messed
with, turn it down. Most of the time overmodulation is what is causing it.

Now I have to go test that theory.

Bye.

Hello Walter:

The number one thing to remember about TVI and neighbor interference, is that you want to be a good neighbor about this. In my case, I bought a RF Proof Phone, and a few High Pass Filters for my neighbors TV, he put em on. Now we're all happy!!!!

These Interference Problems have had a way of even going to court, in rare cases. The Judge will not tolerance radio operators with a belligerent attitude, or negighbors with a belligerent attitude.

Even with a stock none modified CB Radio, you will experience some Interference problems, its not un-common. And even though you maybe in the clear about having a stock legal radio, its still best to be a good neighbor about the hole thing.

The MaCo V5/8 Ground Plane Antenna, and the old out of production antennas, Penetrator 500, and Avanti Sigma 2, are 5/8 Wavelength Ground Plane Antennas, will be a good antenna to use due to the great decrease in neighbor electronics interference, a Ground Plane Antenna has.

The Ground Plane Antennas seem to point way less energy towards the neighbors direction. I wish I had a Dime for every time I have heard this.

Its also a good idea to run barefoot, use a low pass filter, and have the antenna mast and radio well grounded. You want the antenna tuned for the channel your using, at its lowest SWR, this will allow the Loss Pass Filter to work as advertised.

Ones of the biggest causes of TVI is removed or clipped modulation limiter components, there is not real reason they should be removed.

There are many variables to the Interference Problems, and I wish I could suggest a cure all, or fix all, but there ain't any, be advised.

The ARRL sells a couple of books on the subject of RFI!, there web site address is at:
http://www.arrl.org/tis/info/rfigen.html

The book is well worth reading!

Be careful being a good neighbor about this can also get you in trouble. By you buying filters etc, makes some people think it is you supplying these items means the problem is because of you and your responsibility to remove it. Lets say you filter the phone but for some reason can't get out of a stereo or TV. They expect you to do something sinc eit is now your responsibility. Just becareful, if and when you do buy something let them know you are doing it because you want to help and are under no responsibility to provide the filters or a solution to the problem. You may be the cause of the interference since you are transmiting, but the problem is there because of lack of filtering etc. Just be careful how you approach neighborw when supplying filters. the best of friends will turn against you if you are causing something they don't want to put up with.

You really need to get to a decent antenna.
Glassmounts, on CB frequencies, are pretty bad.
Size matters. The 9' steel whip is pretty hard to beat, and is pretty rugged as well.
There's not a whole lot of difference between that glassmount, and a paper clip.

I use glassmounts, but I'm using them at 146.46 and 144.39 MHz, where it's a whole lot less of a compromise.

A base-loaded CB antenna on the roof would be WAY more effective than that glassmount, though subject to being knocked off the roof. OTOH, it fails soft, and you can always smack it back on.

Deb,
A tuner/matcher would make the radio 'see' a reasonable
SWR, so sure, it would 'help' that way. But, nothing will
ever make a 'thru-glass' antenna at 11 meters work even
half way 'okay'.

Doesn't sound like the antenna is the problem, better get your rig
checked out. How much power are you running?

2419. Re: Handhelds

Newsgroup: rec.radio.cb
Date: 2002-11-24 21:35:46 UTC

A possible answer is MURS. With a two watt output and a **much** more efficient antenna, you should realize five miles or more between handhelds. ;-)

The purpose of the coil is to provide matching to an antenna that is less than 1/4 wavelength long. Should you remove the coil, your SWR will likely go through the roof. A good heavy coil won't add any appreciable loss (although a coil of light weight wire with considerable resistance will make your SWR look real good over a wide range of frequencies - at the expense of radiated and received signal).

Source record: 144956

Stereos which receive your transmissions are at fault, not the radio. Same with computers. Most problems are with poorly shielded consumer electronics. This usually doesn't pose a problem unless either you are running very high power or are very close to the equipment in question (like a next door neighbor).

Some relief may be found by changing polarization. If your antennas have all been horizontally polarized (such as the dipole), you can try a vertical. A mag mount cb antenna on a sheet of metal may work with less interference (but you'll need to attach some 1/4 wave horizontal wires to that metal to provide a reasonable ground for the antenna).

Good luck & 73 from Rochester, NY
Jim

I only use them in RV installations if I have to. I don't like using them. But an RV poses special problems.

The first one is "The Wife" who doesn't want a cb in the first place.

Secondly, based on the dollar amount some people don't mind spending on their rolling homes, I can't bring myself to drill holes.

So as inconspicuously as possible I place a TG antenna and pray (literally) that it will work well enough to make the customer happy.

I am very quick to point out they aren't the best antenna and most of these customers are only interested in talking to the truck in front of them and listen for road conditions. The matcher comes into play when my fervent prayer didn't work. Nothing like tempting fate, huh.

You guys have been a pleasure to talk to. I remember when I just simply took the newsgroup off of my things to read because of the foul responses. I see that is sorta cleaned up a bit.

The radios are in their original boxes and are in excellent condition. Their only use was for a four day drive from Colorado to Connecticut so two vehicles could stay in contact. The two handhelds are RS model 21-1860, recently received excellent ratings from CR magazine. The mobile is RS model 21-1850. Additional details may be found at http://www.radioshack.com. Asking $100 for the three plus shipping.

Thanks. Its the screwing on the connector that causes me the most problems.
Fingers don't work so well any more. It hurts. I usually whittle the
jacket down a little to get it started. We use the type with the reducers
built in on all of our coax. Like the positive grip. Never liked puttin
solder in them there little wholes. Never know if the person on the other
end of the soldering gun was a heavy handed solderer and melted the interior
core or not.

Thats just my preference.

Your antenna is not your problem... it's the signal going into your antenna
that has high harmonic content.
How much power are you running? What is your equipment list?

> No Jim, that is just to recieve certification, as a ham you don't need
> certification of an amp if it is homebuilt I will provide positive proof of
> both for you:

The amp in question isn't homebuilt. It is a QRO Technologies
HF-2500DX, as indicated by the ad. Just because it CAN transmit above
the legal limit doesn't make it illegal. It's only when it's USED
above the legal limit does it make it illegal, just like having a ham
radio modified to TX on the public safety bands isn't illegal until
your TX on it.

From the website:

"OUTPUT POWER: 1,500 WATTS CONTINIOUS RTTY, CW, SSB; 2,200 TO 2,500
WATTS MAXIMUM INTERMITTENTLY."
"DRIVE POWER: 40 WATTS FOR 1,500 WATTS OUTPUT"

The drive requirement is 40 watts, meeting the high drive power
requirement. This sucker weighs 100 pounds.. wow.. must be a hell of a
shipping cost. :)

I've checked, there's no adjustment openings at all. It's mounted about
two-three inches down from the top of the right rear window. The window does
have fairly dark factory tint though.

Well like I said guys, for my purposes it actually works very well. I just got back from an offroading ride and it worked well, although I don't think the guys at the front of the pack could hear me. My brother and I have identical antennas and we get a good couple of kms worth of range between them, and that's not in direct line of sight by any means. I'm more worried about damaging the radio than the performance issue.

Of course, with the beating my antenna took today (By the time we got to the car wash I found it bent and loosely dangling from the base) it probably won't be around much longer anyway. lol (Kinda like that tree I hit and knocked over, but that's another story.)

What transceiver are you using it on? Many of the older ones, Browning and others used 115 AC in the PTT circuit. Better check that situation. If it is indeed RF, you must have a tremendous amount of output power. Ground the shack with good 2" braid.

Okay group. Im the guy with the GMC conversion van that had the SWR problem with the K-40. I returned the K-40 and installed a 5' Francis Whip on a gutter mount. I mounted it to the lip of the roof by the rear doors. It is now towering over the roof of the van. SWR is perfect now however, the handheld D-104 gets hot and I am getting shocked when I key up. Setup is as follows: Galaxy DX 959, Astatic handheld D-104, Texas Star DX-400, 5' Francis Whip on a gutter mount mounted to the rear roof lip.

<<snip>>

One afternoon when you get into a "piddling" mood, Find a slender piece of wire and replace the
existing whip with that LONGER wire. Then begin trimming the wire in small increments and see
if that has any effect on SWR. If you know someone who has an MFJ 259 Analyzer, you can
measure the antenna and find where (or IF) the resonant frequency is. Then you can trim (or add)
wire as needed to find your desired frequency. I have one of those TG things for listening, and I
discovered my whip was too SHORT. Mine resonated up in the 10 Meter ham band! I lengthen-
ed the whip and all is well. Might work for you, too.

Another approach that might work for you:

Tuned loop.
You'll have to build it yourself. The idea is that you have a full wave loop
of metal tubing, but you can reduce the size somewhat by adding a tuning cap
at the middle of the loop.
It's not a broadband antenna, but it can be very low profile.

There's another variant called a DDRR, very similar.

The D104 has a chrome face and has a special conductive stuff sprayed inside the case for grounding purposes. It also has a clip inside to connect ground to the conductive substance. Make sure this clip is present and making contact when the clamshell is closed up. If you have no problems there... you need to review your grounding. Make sure the radio is grounded with a short lead... preferably a piece of braid.

:
: Thanks. Its the screwing on the connector that causes me the most
problems.
: Fingers don't work so well any more. It hurts. I usually whittle the
: jacket down a little to get it started. We use the type with the reducers
: built in on all of our coax.

the connector only gets screwed about 3/8" onto the jacket and a small dab
of silicone seals it and makes it slide on easier. you can also use a pair
of pliers to tigthen them if your hands can't function, Your not using
reducers unless you use smaller coax,

> Like the positive grip.

What is the positive grip?

> Never liked puttin solder in them there little wholes.

Well that's because you never took the time to master it, it isn't that
hard once shown the correct way you need a 40+ watts gun, and if you
followed the earlier steps the braid is already tinned so not much solder
has to flow in there to have a good electrical connection

> Never know if the person on the other end of the soldering gun was a heavy
handed solderer and >melted the interior core or not.

If you use good coax the center should be teflon no need to worry about the
heat, I also use a small torch to heat the solder that is in the holes when
I am done.

: Thats just my preference.

I am sure it is, but doing it this way you will never have a jumper fail
because of the connector.

And it is an electrical connection as soon as it is soldered

Sounds like a poor ground. You must be running
power, check the ground for everything : Radio, amp
and antenna, make sure it's a clean and a good contact
with the surface.

If it's possible, forget the cb's and use
FRS. It's a lot cleaner and you don't need to
use an external antenna. What are you doing?
IE: mobile to mobile while off-road, while
just traveling, what are you needing them for?

> operating at all?

Trickery in the numbers.... I can make those numbers "say" one thing, as you can have them "say" another.... Accountants do that on a daily basis.... Overall, there are not enough new hams coming into the ranks that will be needed to replace/fill-in the spots that will invariable happen due to death of the larger percentage of current hams, that being the 45-75 age group. Within 10-20 years, we will lose a good chunk of that age group either to accidental or typical health related issues.

Whether or not someone wants to argue the incentive licensing issue, or not, the whole thing won't do a darned bit of good, unless there is the public's knowledge about ham radio.

To be resonant on a certain frequency or band, an antenna should be a
certain length... related to the Wavelength of that frequency.

The wavelength of CB signals is around 11 Metres for your CB frequencies
(10.8 for UK CB). A "half wave" antenna would need to be half of that...
try fitting that on your car.
So, a "loading coil" is added to allow the antenna to be shorter, yet still
work on that frequency.
Remove the coil, and the antenna will need to be much longer.

If operating a base station, you can take advantage of the better efficiency
by using a large antenna with no coil but, for mobile use, you have to
accept some extra losses.

Regards,

Peter.

I will have to disagree with those "short sighted" people who believe that
the antenna cannot be to blame, and that it *must* be the CB.
Obviously, some believe that inteference is a sure sign of a "modified"
radio. When will they wake up from their dream world?

About the inteference...
Inteference to anything that is NOT a reciever (eg. computers,
cd players, etc) CANNOT possibly be caused by a "dirty"
signal. NO amount of harmonics can intefere with something
that is not designed to pick up radio signals.
Inteference to TV, when caused by a "dirty" signal, will cause
inteference on certain channels of frequencies. If you wipe
off ALL channels, the cause is more likely "front end overload"...
their receiver cannot reject a signal that it should be able to.
The most common cause of inteference is "front end overload",
not "dirty" signals.

OK, so for your antenna...
1. The antenna location IS important. As far away from
other equipment and a hight as possible. Clearly, you
are restricted here, but do the best you can to locate
away from other equipment.
2. Make sure all connections are fine and coax is not
damaged.
3. SWR. Make sure that your antenna is tuned as well
as possible. If possible, take the reading at the base
of the antenna.
4. If all else fails, reduce your power... if possible.

CB equipment...
1. If you are causing problems, the last thing you
want is anything illegal. If anything is not what it

should be, get fully legal first, then work from there.
2. More power means more chance of "front end
overload". Reduce your power as low as you can,
then work from there.
For locations where antenna space is restricted,
power is not an option... use as little as possible.
3. Legal equipment should not be putting out anything
nasty... but interference does not automatically
mean that equipment is illegal or modified.

FILTERS...
A low pass filter on the CB will only cure a "dirty" signal.
Your case (interference to computers), suggests that this
is NOT the case.
If all else fails and a filter is required, filters on the affected
equipment is the best option. For TVs, a high pass filter
is used. For audio equipment, wires and leads need to be
filtered to stop them picking up radio signals.
As for the computer... really? They should be pretty well
filtered, to stop them intefering with other equipment.

Have you considered moving to somewhere with space for a good antenna?
I may be on the move again soon... hopefully.

Regards,

Peter.

RV's in this case refer to the Houses on Wheels. You know a Motor Home.
The kind the Robert Pressley, singing groups and very wealthy people drive.
:)

Mostly road traveling. Groups, etc needing the communications. Its in some
of the group rules that they have CB's. I have even had them tell me that
if they go North into Canada in the tundra, they should have a radio that
reaches at least 5 miles. Imagine the pressure. :)

> gutter mount mounted to the rear roof lip.

At great risk of getting flamed here, but once again did you talk with your CB tech about your antenna. Did he/she suggest the gutter mount? Did he/she suggest that you run a Francis with a 400 watt TS? And did he/she really sell you a DX959. Oh, sorry. Disappointing radio for me.

Anyways, I never suggest a Francis with power. But that is because, even though some have told me they run over a 1000 watts through one, I am pretty sure that it won't hold up to the abuse. After all, it is the smallest copper wire antenna made. It is not rated for power at all.

You are probably having an RF Breakdown because of the antenna. Conversion vans do pose a question. You want to run the power then you are either going to have to modify the top of the van to accept and give acceptable ground plane to allow an antenna to work and stay out of the tree's.

Or you can put an antenna that is rated for the power you want to run, on the front somewhere. There are plenty of mounts out there that will adapts. Get a good ground.

Once you get the correct antenna, grounded properly, your mic problems will go away. Please be careful if you are going to open the mic up. 9 out of 10 times it has nothing to do with the equipment inside unless you have a jumper breaking down in between the radio and amp. It is outside.

These are strictly my opinions of years of working with this equipment. Remember RF burns you from the inside out. Oh, it is likened to sitting in the microwave and going around in circles. I have seen some pretty nasty burns. Here is another tip, DON'T hold on to the antenna when you key up. It gets hot.

Deb

Thanks for the tips. I take great care when I make the jumpers. We use Weller equipment both inside and outside. So far in 17 years (knock on wood) I have never had coax fail because of a connector. Now I have had to replace tips on those pesky irons though. :) I use them a lot.

Your right about the reducer and I knew that. My fingers on this keyboard engaged before my brain, or is that the other way around.

I started crocheting again. Maybe that will help with the hand strength. :) If nothing else I will finally get all this yarn out of my craft room.

I don't see this as a detriment to ham radio, more as a tradition.

> 4. Encourage Amateurs to not have their lives revolve around "Hamming".

Like many hobbies, people put effort into it, that's proportional to
their interest.

> 5. Encourage Amateurs to lose weight.

I might be able to lose 10 Lbs, but that won't change much. Another
stereotype pehaps?

> 6. Get more females, young people into Amateur radio.

How about just getting more people who are interested in RADIO?

>
> 7. Get rid of QST and bring back Ham Radio magazine
> (but change the name to Amateur Radio magazine).

Another personal issue?

> 8. Get more people involved in: Homebrewing, radio direction finding,
> troubleshooting, use of test equipment, antenna building.

I'll agreee with this. Are you volunteering to spearhead this
undertaking?

> 9. Positive publicity - positive publicity spots in newspapers, etc.
> Endorsements by celebrities, Amateur radio in movies.

Yea, that just what we need. Endorsements by airhead celebrities, who
probably can't even spell "Ham radio". Ham radio in movies? Look what
that did for CB in the 70's. After Smokey & the bandit, Convoy,
Citizen's Band and a few others, CB became nothing more than a mindless
fad, with loads of mindless people, who contibuted nothing but more

interference. The good operators got lost in the crowd. Do we want that
for ham radio as well?

> 10. More clout with politicians.

There have been many politicians with ham licenses. Most notably, Barry
Goldwater.

> 11. Stress educational benefits, such as geography, etc.
> 12. Collaboration with EE education and IEEE, not separation from them.
> 13. Real development activities through Amateur radio clubs.

Good ideas, we just need organizers. Who has some extra time to spend?

> 14. Real tests of viability of certain modes by getting large numbers of people
> to test them.

This goes on now. Look at Packet radio and APRS.

> 15. Get rid of the Morse code requirement.

This goes without saying, although there should still be some
recognition for mastering the mode. It should just not be a requirement
for operation.

> 16. Encourage an adequate number of coders - but don't tie this to the license
> classes.

Exactly.

> 17. Morse certificate for 5 wpm, Morse with distinction for 13wpm

Good.

>
> 18. Real license preparation classes to understand the material.
> 19. Non-question pool format for written tests.

Big improvement. But could create some logistical issues.

> 20. Call the license classes Novice, Intermediate, Advanced instead of
> Technician, General, Extra
> (Clearer terminology and more respectful of achievement).
